In this chapter we evaluate the impact of the “Service Leadership” subject which was offered to students in semester 1 and 3 of the 2015/16 academic year at PolyU. The modified Subjective Outcome Evaluation Scale (SOES) was utilized for evaluation that examines the perceived satisfaction and impact of the subject. The scale included areas of assessment in program content (i.e., course design), program instructors (i.e., teaching skills), program benefits (i.e., enhancement of social competence), and overall satisfaction (i.e., global satisfaction of student participants). There are several expectations of the research findings: 1) if the program implemented as planned, most of the participants would give positive views towards all the measuring scales, and 2) in line with previous findings, we would expect significant correlation amongst the different aspects of client satisfaction, including program quality, instructor quality, benefits of taking the course, and overall satisfaction.

OUR STUDY

The “Service Leadership” subject was offered to students at PolyU in semester 1 and 3 of the 2015/16 academic year. In the end of the semesters, all the students (semester 1: 42 students; semester 3: 64 students; overall: 106 students) were invited to complete a subjective outcome evaluation form to evaluate their perception of the program. Before they complete the evaluation form, the student participants were told about the purpose of the evaluation and were asked to fill out a written consent form. The evaluation form was self-administrated in paper-pencil based mode. They were given adequate time to complete all the items in the form, and teaching assistants were on site for any questions that bought by the students. All evaluation forms were collected upon completion.

Instruments

A modified “Subjective Outcome Evaluation Scale” (SOES) was used to examine the student participants’ subjective perception of the “Service Leadership” subject. The SOES, which showed good psychometric properties (see Result section for details), was widely used in previous studies [18-20] to study the impact of the program based on the perception of program recipients (the students in the current study). The SOES is a 5-point Likert scale which comprised of several parts as follows:

- 1) Program Content (PC): Perception of students on the program, for examples, objectives and design of the program, interaction between students, and classroom atmosphere, etc. (10 items). Examples of the items are “The content design of the curriculum is very good.” and “The learning experience enhanced my interests towards the program.”
- 2) Program Instructors (PI): 10 items related to students’ perceptions of the instructor(s), including class preparation, professional attitude (i.e., “The instructor(s) showed good professional attitudes.”), teaching skills (i.e., “The teaching skills of the instructor(s) were good.”), class involvement (i.e., “The instructor(s) was (were) very involved.”), and quality of interaction with students (i.e., “The instructor(s) had much interaction with the students.”).
- 3) Program Benefits (PB): Student participants’ perception of the perceived program benefits, for instances, the promotion of their social competence and personal development (18 items). Examples of the items are: “It has increased my competence in making sensible and wise choices” and “It has enabled me to understand the importance of situational task competencies, character strength and caring disposition in successful leadership.”

In addition to the above-mentioned parts, there are two parts in the SOES that target on understanding the global satisfaction and student participants’ additional feedback:

- 1) Overall Satisfaction (OS): assessing the students’ global satisfaction, such as recommending the program to their friends (i.e., “Will you suggest your friends to take this program?”), their intention to join the similar program in future (i.e., “Will you participate in similar programs again in the future?”), and satisfaction with the program in general (i.e., “On the whole, are you satisfied with this program?”) through a 5-point Likert scale.
- 2) Four open-ended questions asking the student participants’ program experience and their feedback to the program, such as their learning experience (i.e., “the most important thing you have learned from the program”), things that they most appreciated (i.e., “appreciate most in this course”), instructors (i.e., “comments about the instructor(s)”), and areas for improvement (i.e., “suggestions on the improvement area”).

Data Analyses

The statistical package of SPSS 25 [23] was used to analyze the collected data from the participants. The psychometrics properties of SOES showed good reliability in previous studies [e.g.: 19, 20-22]. The psychometric properties, specifically the reliability, of the SOES was first examined. The score of each subscale items was added up and divided by the number of items in the subscale to create the composite measures of the subscale. Percentage analyses were then conducted to study the student participants' responses on the quantitative items (i.e., PC, PI, PB, and OS). The data was analyzed and reported separately by semesters (i.e., semester 1 and semester 3) and a combined group of student participants in overall score (i.e., combined both semesters). Correlation was performed to investigate the relationships amongst the subscales. The predictive effects of student participants' perception on PC, PI, PB, and OS were tested through multiple regression analyses.

FINDINGS

The mean, standard deviation, and reliability analyses of each subscale are shown on Table 1. Consistent with previous studies [19, 20], the SOES in the present study showed good reliability. For the combined group of students from both semesters, the overall Cronbach's alpha (α) in each of the subscales was .74 or above: PC (α = .87; Mean inter-item correlation = .41), PI (α = .93; Mean inter-item correlation = .58), PB (α = .94; Mean inter-item correlation = .48), and OS (α = .74; Mean inter-item correlation = .53). It supported that the SOES was internally consistent for the present study. The mean score in each of the subscale were above 4.0 (PC, M = 4.17; PI, M = 4.49; PB, M = 4.02; OS, M = 4.02).

As shown in Table 1 and 2, program content was positively perceived by the student participants (semester 1, M = 4.10; semester 3, M = 4.23; overall, M = 4.17). For instances, majority of the student participants rated agree or strongly agree that they liked the pleasant atmosphere in classroom (overall = 97.2%), the clear program objective (overall = 95.3%), and rated a very positive evaluation of the program (overall = 94.3%). There were also more than 90% of the student participants (n = 98, 92.5%) agreed or strongly agreed the activities were carefully arranged, a great amount of peer interaction, and the learning experience enhanced their interest towards the program. When they were asked to express their thoughts on what they most appreciated in this subject, they responded in several perspectives of the program, including *"This class has a lot of class activities and discussions, very interesting," "Relaxing environment to learn," and "Interactive lecture, using lots of activities and games for us to participate; instructor put lots of efforts to make the lectures more interesting."*

Supported by the findings shown in Table 3, over 93% of the students in both semesters reported positive responses in all the items in PI. The students were highly satisfied with the program instructors' performance (semester 1, M = 4.45; semester 3, M = 4.52; overall, M = 4.49). There were about 99% of the student participants (105 out of 106) perceived the instructors were very involved and encouraging for every students' participation. Also, about 98% of the students (104 out of 106) appreciated the instructors on their professional attitude, the caring for the students, and the help that offered to students when they are needed. The positive responses from the open-ended questions highlighted more to support the

quantitative part: students' responses mentioned about the well-organized and professionalism of the teaching team, such as *"Very (w)ell-prepared and caring lectures with a great team with passion for teaching, really learn a lot from lecture and also from the role model of the teacher."* and *"Instructor and other teachers were very well organized throughout all past lectures. I genuinely appreciate for involving many activities that I will not be able to find in other programs,"* and the teaching team's helpfulness and encouragement for students' participation, such as *"Willing to help students when they have questions. Encourage students to be active in class."*

The student participants' perception to program benefits (PB), shown in Table 4, were positively recognized (semester 1, $M = 4.03$; semester 3, $M = 4.02$; overall, $M = 4.02$). Majority of the student participants rated that the program massively improved their social competence (91.5%), for instance, a student responded that *"Though this subject teaches us how to be a good leader, more importantly, it teaches us how to get along well with the others."* They acquired a good and better understanding of the covered program content (i.e., theories, concept, and research) which related to a successful service leader (89.6% - 92.5%). There were similar responses from the students such as *"The $E=MC^2$, not only the theory, the knowledge but really how to practice it, how to use it applies to in daily life."* and *"I have learned how to be a professional service leader throughout participating in the lectures. Besides, I learned to accept others' ideas."* Compared with the other items in this subscale, items related to life, such as enhancing the love and meaning of life, were perceived particularly less influential to students (73.6% and 72.5%, respectively). This finding is consistent with previous findings [19, 24].

The responses to the three items that measure the student participants' overall satisfaction (OS) are shown in Table 5. They indicated high satisfaction with the subject (95.3%) and will recommend their friends to take this program (90.6%). However, they showed less interest in taking a similar subject in the future (67.9%). The pattern was similar to the previous studies (i.e., 19, 25, 26).

To study any differences in the subscales (i.e., PC, PI, and PB) across semesters, a one-way ANOVA was performed with the subscales as dependent variables and semesters (i.e., semester 1 and semester 3) as independent variables. Table 6 shows that there was no significant difference found in the analysis. This indicates the implication of no significant difference in how the student participants perceived the program in semester 1 and semester 3. Therefore, two sets of data from semester 1 and 3 were combined as a full set of overall group to perform correlation and multiple regression analyses to study the correlations between subscales and predictive factors.

Table 7 presents the results of the correlation of each subscale. Consistent with previous studies [19, 24], there were significant correlations amongst the different measures in the client satisfaction survey. We further conducted multiple regression analyses to examine the factors predicting perceived benefits and overall satisfaction of the program (see Table 8). Both the PC and PI were predictive factors of PB ($\beta = 0.76$, $p < .001$; $\beta = 0.24$, $p < .001$). For the overall satisfaction of the program, PB was the only predictive factor ($\beta = 0.44$, $p < .05$).

DISCUSSION

The study was to evaluate the impact of “Subjective Leadership” subject that was offered to students at PolyU in both semester 1 and semester 3 in the academic year 2015/16 based on the client satisfaction approach. Using the modified SOES with a 5-point scale, we examined four dimensions of the students’ perception towards the subject, including program content (i.e., the design and objective of the subject), program instructors (i.e., class preparation and teaching skills of instructor), program benefits (i.e., promotion of psychosocial competence and personal development), and overall satisfaction (i.e., program recommendation to friends and intention to take similar subject in the future). There were also four open-ended questions looking for comprehensive and constructive information that could support the statistical findings and provide a broader perspective in understanding the students’ perceptions.

The subject “Service Leadership” aimed to promote the service leadership qualities and overall development of university students. In summary, the results were consistent with our prediction that the students expressed positive perception with the mean score above 4.0 in each of the four subscales - PC, PI, PB, and OS. The results are reliable, as compared with the previous studies [18-20]. Results of the one-way ANOVA showed that the students in semester 1 and semester 3 had no significant difference in the results of all the subscales, which allowed to view and analyze the students in two semesters as one group on correlations between subscales and predictive factors of program benefits and overall satisfaction.

The student participants in both semesters with an overall mean score of 4.17 reported positive evaluation on the overall program content, such as clear program objective, carefully planned class activities, and a great environment for learning. The program was very stimulating to the students that they appreciated the interactive lectures which provided a sufficient amount of time on peer interaction to make the class more interesting and relaxing. In assessing instructors’ quality subscale, the majority of the students (more than 90%) with an average mean score of 4.49 rated with positive responses in all the measured items. All the students rated positively on the instructors’ evaluation. The results from open-ended questions echoed with the statistical findings that elucidated the professionalism and well-organization of the teaching instructors that they believed this type of quality teaching will not be able to find in other similar programs. The encouragement and helpfulness from instructors helped each of the students in getting involved in the activities and ensured that their needs were being met. Further, most of the students with an average response score of 4.02 in the program benefits subscale found that the program improved their social competence and helped them understand the concept of service leadership. The covered materials in the subject, such as the research concepts, supported them to better understand the attributes of being an effective service leader. However, there were only about 70% of the students perceived that the program enhanced their love for life and the exploration to finding the meaning of life. This may be due to the short duration of the subject. More than 90% of the students reported high overall satisfaction towards the program and would recommend to their friends in joining the program.

Table 1. Cronbach's alphas, mean, standard deviation, and mean of inter-item correlations of Subjective Outcome Evaluation

Variable(s)	Semester 1 (n = 42)				Semester 3 (n = 64)				Overall (n = 106)			
	Mean	SD	α	Mean [#]	Mean	SD	α	Mean [#]	Mean	SD	α	Mean [#]

Program Benefits					0.63	.028	.44*	

Note. * $p < .05$; *** $p < .001$.

For inter-correlations between all the subscales of SOES, there were significant positive relationships with the strength ranging from 0.36 to 0.74. Inconsistent with the results in previous studies that only perceived program content predicted program benefits [19, 25], the current study found that both program quality and instructors' quality were significant predictors of program benefits. The relationship implies the importance of both the subject matter and performance of the instructors shape the learning outcomes. It was beyond any doubt that the perception of the students towards the benefits they received was highly dependent on the way of how an instructor in delivering a comprehensive program structure in the program content. The students highly valued the benefits of the program because of the combination of a wide range of skills and abilities that they have learned in the program along with the thoughtful instructors would be beneficial to them in having a competitive edge in

the labor market and advancing their personal development. In addition, program benefits was the significant predictor of overall satisfaction. It was not consistent with past studies that program content and program benefits explained overall satisfaction [25]. The high satisfaction could be due to the overall view of students towards the program benefits that were predicted by the program content and program instructors in order to willingly make a recommendation to their friends in joining this program.

The “Service Leadership” subject was found to be effective in satisfying the needs of university students in promoting the important qualities of successful service leaders and advocating positive youth development. The results were aligned with past studies that participants held a positive perception of the program in its content, instructors, and benefits [19, 20, 25, 26]. The results in current study also had evidently higher percentage of positive responses in program content, quality of program instructors, and program benefits as compared to the reported percentage of positive responses that collected from those who signed up for the “Service Leadership” subject in the academic years of 2012/13 [19], 2013/14 [20, 26], and 2014/15 [25]. The improved perception from students could be partly due to the fact of continuous revision on the program content based on the feedback from previous students and the instructors’ familiarity with ways of delivering the knowledge and experiences to the students.

However, we identified several weaknesses of this study. First, future studies should consider taking an approach that examines other factors which might have an influential effect over the perception towards the program for evaluation, such as program participation (e.g., attendance) and duration of the program lectures. Second, it might also worth exploring the gender relations interactions between instructors and students in the program, suggesting two gender effects that the views of male or female students have on the same- or opposite-sex instructors. Third, the comparison of different evaluation methods, such as objective measure and in-depth qualitative reflections and narratives, are necessary to explore their perception of the learning experience.

Traditionally, leadership style may have been associated with a stronger emphasis on the hierarchical structure to enable and empower the employees to excel. While millennials are gradually taking leadership roles and the Generation Z will begin entering the labor market, it is important for the universities to equip their students in reaching full potentials and advancing their personal development. Obviously, the subject “Service Leadership” is a good way to equip students with leadership qualities in the rapidly changing service economies.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is based with permission on a paper adapted from a special issue published in the *International Journal of Child and Adolescent Health* 2020;13(2) issue.

Chapter 128

IMPACT OF A LEADERSHIP PROGRAM ON THE HOLISTIC DEVELOPMENT OF UNIVERSITY STUDENTS IN HONG KONG

ABSTRACT

In this chapter we examine the effectiveness of the SOAR Youth Leadership Program in the 2017-2018 academic year, using a mixed-method approach of both quantitative and qualitative evaluation method. There were 49 university students from three universities completed the evaluation on responding to subjective outcome evaluation form and personal reflection form. A significant percentage of student participants expressed positive responses with the program content, program instructors, and program effectiveness. Consistent with our expectation, there were significant positive correlations among program content, program instructors, program effectiveness, total effectiveness, and overall satisfaction. The participants described the program in positive descriptors and all the related metaphors were positive in nature. The results in this study supported the positive and strong influence of the program in promoting leadership skills and competence for our university students.

INTRODUCTION

Fast changes in the economic and political environment led to a growing demand for effective leadership [1]. Under the influence of globalization, there is a pressing need to improve the leadership skills in meeting the uprising demands of effective management with reference to challenges and uncertainties [2]. Leadership skills are crucial for both personal and professional development, especially in times of crisis. The skills of trustworthiness, collaboration, as well as influencing and inspiring others were considered essential skills by leading experts in both Europe and the United States [3]. The concept of leadership is also transforming. As more millennials are progressing into leadership and management role, they become a major influence in transforming from traditional hierarchical style to a relatively flat culture with less bureaucracy. The conventional approach to managing a team in a rigid manner has shifted to leading a team with more flexibility and openness [4].

Effective leaders often need to be familiar with personal (e.g., be trustable, caring, and moral) and professional (e.g., setting mission, process, and procedures) leadership behaviors to constantly motivate people to willingly contribute their efforts [5]. Benevolent leadership can also bring considerable positive impact and favorable outcomes, such as employees' creativity [6], whereas poor leadership can be destructive and cause losses and damages [7]. Nurturing young talents with leadership has become a top priority in every society's development plan to ensure that young people are equipped with skills and competitiveness in making an impact and leading to create a positive influence on the world.

In response to the rapidly evolving environment, the Global Youth Leadership Institute as an education and research hub that was established by The Hong Kong Polytechnic University is dedicated to nurture their university students through a wide range of cross-cultural, innovative and reflective "Service Leadership" programs that focused on positive values and community engagement [8]. The institute provides training and courses to equip many university students to become leaders and bring positive influence to society. The key objectives of the institute are 1) to nurture global youth leaders with the vision and competence in thinking globally to make contribution to the society, 2) to develop excellence in youth leadership education worldwide through the implementation of pioneering and innovative youth leadership curricula, and 3) to push forward on researching global youth leadership and service-learning education. The programs can better prepare university students with exceptional leadership qualities and global competencies. Systematic evaluation studies showed that students benefit from the programs.

With the global economic integration that creates enormous room and opportunities in collaboration and operations without worrying geography or distance in modern technological landscape, the institute also attempts to support university students' in building capabilities to make connection to different parts of the world through joining an international platform of the University Social Responsibility Network for leadership development. The network was established in 2015 that has a total of 16 member institutions worldwide that covered six out of seven continents, including United States, Canada, Brazil, South Africa, United Kingdom, Israel, Kazakhstan, Korea, Japan, China, Hong Kong, and Australia. The missions of the network are 1) to establish a platform for exchanging concepts, resources, policies, practices, difficulties, and solutions to each of the network members, 2) to develop projects in a collaborative manner with varied scopes and scales within the network, and 3) to contribute to

discussions and development worldwide through networking and partnership within the network, as well as with other allied institutions.

In Hong Kong, the Global Youth Leadership Institute has teamed up with other universities to carry out non-credit programs, such as the SOAR Youth Leadership Program. The program serves as an international exchange platform for building cultural connection and cross-cultural competence. Sponsored by Si Yuan Foundation and Zeshan Foundation, Global Youth Leadership Institute, Peking University, and Xi'an Jiaotong University jointly organized SOAR (Serving heart, Open-mindedness, Aspiration, Responsibility) Youth Leadership Program. SOAR was an integration of two programs, namely the Global Youth Leadership Program and Silk Road Youth Leadership Program. The Global Youth Leadership Program (GYLP) aims at nurturing students at The Hong Kong Polytechnic University and Peking University on qualities of service leadership, such as competencies, character and caring disposition. The program attempts to support students in gaining knowledge, experiences, reflection and hands-on experience through lectures, dialogues, personal experience in activities and service in Mainland China, Hong Kong, and Cambodia.

In a study using six waves of data on objective outcome evaluation, university students from Hong Kong, mainland China, Korea, Taiwan, Thailand, and the United States enrolled in the GYLP program. A total of eighty-nine of them completed all the assessments. The results showed that significant improvement was evidenced across outcome measures on positive attributes of development, competencies in service leadership, and increased satisfaction to life [9]. With the launch of “Belt and Road Initiative” by the Central Government of China, there was an introduction to Silk Road Leadership Program (SRYLP) in the 2015-16 academic year to students at The Hong Kong Polytechnic University, Peking University, and Xi'an Jiaotong University. The evaluation on a 3.5-day (21 hours) service leadership program of SRYLP was highly positive on its program content, program instructors, and program benefits, with nearly 90% of the student participants showed program satisfaction [10]. The evaluations on different components of the program resulted in significant positive correlations. While perceived program content from the student participants predicted program benefits, the content and perceived program benefits predicted the overall satisfaction that was rated by the students. In a pre-and-post study using objective outcome evaluation that examined changes in university students after attending an intensive program under “Silk Road Youth Leadership Program” in mainland China, results showed that students experienced a positive impact on improving their knowledge on youth development, satisfaction to life, service leadership beliefs and qualities [11]. Over three assessment periods (i.e., pre-test before the program, post-test immediately after the program, and 12-day follow-up test after the program), the results also indicated a stable trend of improvement on these measures and significantly or marginally higher scores at post-test and follow-up test.

Evaluation of the leadership programs' effectiveness and participants' recommendation is essential in providing constructive feedback, which can be addressed in the planning and implementation of future programs [12, 13]. For example, a study found that particular personal characteristics of a program instructor, such as having a sense of humor and youth engagement strategies, could increase the effectiveness of positive youth development [14]. Therefore, the identification of staff members' characteristics and performance on how to engage with youth can provide a competitive edge. Gender differences in relation to leadership development programs were also revealed in other evaluation studies. When

participants' reflection in leadership development programs was used as a measure of effectiveness, the results found that there were subtle changes in the behavioral and cognitive responses along the way [15].

As leadership programs are at its infancy in Hong Kong, there is a need for collecting more supporting evidence on the effectiveness of leadership programs. In this study, we examine the Youth Leadership Program's effectiveness in the 2017-2018 academic year. The leadership program was developed to cultivate students in a holistic manner, including the promotion of their moral character (sense of social reasonability), leadership competencies (intrapersonal, interpersonal, and self-leadership), and caring disposition in maintaining a positive relationship. During the one-year program, the university students that enrolled were introduced to the basic models of leadership, basic attributes of leadership, reflection on their leadership qualities, application of knowledge as a promising leader, and the need for their development. The students also participated in study trips, youth forum, and service learning in the "Belt and Road Initiative" countries with a focus on the concept of service leadership and the development of China, Central Asia, and the Middle East. The opportunity in the discovery that was given in the program supported them to constantly reflect their personal values and build up self-confidence. All the knowledge and experience was important for the students to demonstrate their competencies in leading and understanding the needs of various stakeholders and to utilize their skills to lead others and the society in moving forward.

To assess the program effectiveness at The Hong Kong Polytechnic University, we have previously used several approaches for evaluation, such as objective and subjective outcome evaluations and qualitative evaluation. This evaluation study adopted the mixed-method approach (i.e., integration of quantitative and qualitative evaluation method) to assess program effectiveness. Mixed method research employs both approaches to evaluate a program from different perspectives. By integrating the quantitative data with qualitative data, it will provide a more comprehensive picture of the program impact in a more elaborated manner. This approach helps to explore broader perspectives and reveal relationships that occur between the layers of the multifaceted research questions [16]. The results of a mixed-method approach can increase findings of reliability and credibility by revealing concepts that are a representation of the phenomenon.

In this study, upon the program completion, the students were asked to provide their personal views and learning experience of the program. There are several expectations. First, if the program worked well, we would expect a high proportion of the participants showing positive responses. Second, based on previous research, we would expect significant correlations amongst different components of subjective outcome evaluation (i.e., program content, instructor quality, program effectiveness). Third, it was expected that the qualitative data would present the views of the students to be positive in nature.

OUR STUDY

In the 2017-2018 academic year, a total of 49 students completed the SOAR Youth Leadership program in Xi'an. There were 17 males (34.7%), 30 females (61.2%), and two students not indicating their gender status (4.1%). The students primarily came from three different universities - 22 from the Hong Kong Polytechnic University, 12 from Peking

University, 13 from Xian Jiaotong University, and two unknowns. The age range of the students was between the age of 17 to 21, with the mean age of 18.9 years.

The effectiveness of the SOAR Youth Leadership program in Xi'an in the 2017-2018 academic year was examined by the mixed-method approach of integrating both quantitative and qualitative analysis. Students' informed consent was obtained before the study, with the emphasis on confidentiality, anonymity and voluntary participation. They were also being informed of the rights to withdraw from this study without any consequences. All the data were collected by the program instructors that followed a standardized data collection protocol.

Instruments

The Subjective Outcome Evaluation Form targeted to measure students' views of the program. It is a validated measure that was used in previous studies on assessing participants' perceptions [17]. There were 10 items each on evaluating program content (e.g., such as objective, content design, and activities) and program instructor (e.g., mastery, preparation, and teaching skills). The possible responses are 1 (Strongly disagree), 2 (Disagree), 3 (Neutral), 4 (Agree), and 5 (Strongly agree). Further, there were 18 items on evaluating program effectiveness (e.g., enhancement on participants' social competence, self-awareness, and resilience). The possible responses are 1 (Very unhelpful), 2 (Unhelpful), 3 (Not sure), 4 (Helpful), and 5 (Very helpful). Following program effectiveness, there were 3 items also using five-point Likert scale that measure the participants' willingness in recommending the program to their peers, willingness in participating similar program from this time forward, and their contentment with the program. At last, there were 4 open-ended questions concerning the participants' program experience, including the most important thing(s) learned in the program, the things that most appreciated, comments about program instructors, and areas for improvement.

The Personal Reflection Form was used to measure participants' responses to the overall learning experience in the program. They were invited to give feedback on the program on a reflection sheet that consisted of two parts: 1) to ask participants to use three words or phrases as descriptors (e.g., interesting, boring, reflective) to describe their feelings, perceptions, and experiences of the program, and 2) to think of an object, an event, or state as metaphors that can be best described the program. (e.g., an enjoyable experience, a compass) and a brief explanation of the meaning of the metaphors they used. This method of narrating in descriptors and metaphors was effectively used in the previous studies [18, 19, 20, 21].

Data Analyses

For quantitative data, there were analyses on reliability to examine the internal consistency of the subjective outcome evaluation form. Descriptive statistical analyses were performed to assess the participants' responses to the content, program instructors, program effectiveness, and perceptions of other aspects. Pearson's correlation tests were used to

understand any inter-correlation coefficients between the program content, program instructors, program effectiveness, total effectiveness, and overall satisfaction.

For qualitative analysis, data of subjective outcome evaluation form and personal reflection form were coded and categorized by an independent researcher with training in social sciences, who was blinded and had no involvement in the study. Participants’ qualitative responses were categorized into 1) positive, 2) neutral, 3) negative, or 4) undecided. Coding of descriptors and metaphors of the personal reflection form was completed prior to categorization. A statement that consists of two meaningful units was separated into two independent meaningful units, for instance, “interesting and fruitful” into “interesting” and “fruitful.” Meanwhile, two statements with similar meaningful units were grouped into one meaningful unit, for instance, “funny” and “interesting” into “funny/interesting.” Descriptive statistical analyses with highlights were performed to examine participants’ responses to the program. Inter- and intra-rater reliability measures were computed.

FINDINGS

Table 1 shows the mean, standard deviation, and reliability analyses. The internal consistency of the subjective outcome evaluation form was high. Program instructors had the highest mean score (Mean = 4.33, SD = .51), followed by program content (Mean = 4.24, SD = .55) and total effectiveness (Mean = 4.19, SD = .55). The lowest mean score was overall satisfaction (Mean = 3.93, SD = .79). The Cronbach’s alpha of program content, program instructors and program effectiveness ranged from .90 to .96. The Cronbach’s alpha of total effectiveness is .97, whereas overall satisfaction is .88.

Table 1. Mean, standard deviation, Cronbach’s alphas, and mean of inter-item correlations

Variable(s)	Mean	Standard deviation	Cronbach's alpha	Mean inter-item correlations
Program content (10 items)	4.24	.55	.90	.47
Program instructors (10 items)	4.33	.51	.91	.52
Program effectiveness (18 items)	4.09	.63	.96	.57
Total effectiveness (38 items)	4.19	.55	.97	.49
Overall Satisfaction (3 items)	3.93	.79	.88	.73

Table 2 to 5 present the results of descriptive statistical analyses. Consistent with our expectation, a significant proportion of the student participants expressed their satisfaction. The evaluation on program content received 77.6% to 98.0% of positive responses that rated agree or strongly agree, with the highest percentage of positive responses were pleasant classroom atmosphere (98.0%) and a great amount of peer interaction (95.9%) (see Table 2). The lowest percentage of positive response on program content was the learning experience that enhanced interest in the lessons (77.6%). The evaluation of program instructors received 75.5% to 95.9% of positive responses (see Table 3). There were four items on program instructors received the highest percentage of positive responses (95.9%), including good preparation, encouragement for students to participate in activities, caring for students, and

much interaction with students. The lowest percentage of positive response on program instructor was the teaching skills were good (75.5%). A high proportion of student participants (71.4% to 95.9%) gave positive responses to items on program effectiveness (see Table 4). Two items exceed 90% of positive responses – cultivation for compassion and caring (95.9%) and enhancement on self-leadership ability (91.8%). The lowest percentage of positive response on program effectiveness was the program has strengthened self-confidence (71.4%). Further, as shown in Table 5, there were 44 out of 49 participants (88.9%) expressed positive satisfaction with the program. More than two-thirds of the participants (77.6%) reported their willingness to recommend other peers in taking the program. A total of 65.3% of participants also expressed their willingness to enroll in similar programs in the future. In summary, they were contented with the program and certain areas of improvement will be needed.

Table 6 shows the Pearson correlation analyses. As predicted, significant correlation coefficients were observed in program content, program instructors, program effectiveness, total effectiveness, and overall satisfaction. Both program content ($r = .86, p < .001$) and program instructors ($r = .81, p < .001$) were positively correlated with program effectiveness. Meanwhile, there was a significant positive correlation between program content and program instructors ($r = .81, p < .001$). Total effectiveness also showed a significantly positive correlation with program content ($r = .94, p < .001$), program instructors ($r = .90, p < .001$), and program effectiveness ($r = .97, p < .001$). Regarding overall satisfaction, significant positive correlation was observed with program content ($r = .78, p < .001$), program instructors ($r = .72, p < .001$), program effectiveness ($r = .76, p < .001$), and total effectiveness ($r = .80, p < .001$). To conclude, participants' evaluation on different aspects of the program appeared to be consistent and strongly inter-correlated.

Table 7 summarizes the participants' written comments on the program. A total of 91.8% of participants expressed positive responses to the most important things that they learned in the program, a finding which supports our expectation. For instance, one of the students commented that "Respect. Be humble to learn from different people. Serve before leading," while another student commented, "Different people have different angles, and other classmates/opinions force me to think critically more." In regards to the things that participants most appreciated in the program, 98% of the respondents expressed their appreciation, with 48 out of 49 participants rated positive responses. The quotes were "Instructors always give us much time to share our opinions, to play interactive games and to reflect what we've learned in the class." and "There are a lot of interactions within the students and also with the tutors." Meanwhile, there were 59.2% of the participants commented positively on the program instructors. They described the instructors as "a strong sense of caring disposition. She presents the content very well with passion. Listening to their sharing is indeed meaningful" and "patient and loving; very professional and caring." When asking for areas of improvement, there were 87.8% of the participants expressed their views, such as "can be taught with more academic way and more example of real cases about leadership," "more discussion with other groups may be better for us to make new friends and gain more ideas," and "more thorough explanations on theories or practical usages."

Table 2. Descriptive statistics of the participants' evaluations on the program content

Your views towards the program contents:	1 Strongly Disagree		2 Disagree		3 Neutral		4 Agree		5 Strongly Agree		Positive responses (Options 4-5)	
	n	%	n	%	n	%	n	%	n	%	n	%
1) The objectives of the curriculum are very clear.	1	2.0	4	8.2	0	0.0	31	63.3	13	26.5	44	89.8
2) The design of the curriculum is very good.	1	2.0	10	20.4	0	0.0	26	53.1	12	24.5	38	77.6
3) The activities were carefully planned.	1	2.0	4	8.2	0	0.0	20	40.8	24	49.0	44	89.8
4) The classroom atmosphere was very pleasant.	0	0.0	0	0.0	1	2.0	13	26.5	35	71.4	48	98.0
5) There was much peer interaction among the students.	0	0.0	0	0.0	2	4.1	12	24.5	35	71.4	47	95.9
6) I participated actively during lessons (including discussions, sharing, games, etc.).	0	0.0	1	2.0	5	10.2	26	53.1	17	34.7	43	87.8
7) I was encouraged to do my best.	0	0.0	3	6.1	4	8.2	24	49.0	18	36.7	42	85.7
8) The learning experience I encountered enhanced my interest towards the lessons.	1	2.0	2	4.1	8	16.3	25	51.0	13	26.5	38	77.6
9) Overall speaking, I have a very positive evaluation of the program.	1	2.0	0	0.0	7	14.3	23	46.9	18	36.7	41	83.7
10) On the whole, I like this curriculum very much.	1	2.0	0	0.0	8	16.3	23	46.9	17	34.7	40	81.6

Table 3. Descriptive statistics of the participants' evaluations of the program instructors

Your views towards the instructor(s):	1 Strongly Disagree		2 Disagree		3 Neutral		4 Agree		5 Strongly Agree		Positive responses (Options 4-5)	
	n	%	n	%	n	%	n	%	n	%	n	%

Table 7. Summary of students' written comments on the program

Item(s)	Positive responses	Total responses	Percentage (%)	Highlights
1) The most important thing(s) learned in the program	45	49	91.8	"Respect. Be humble to learn from different people. Serve before leading." "I learned how to care about others" "Different people have different angles; and other classmates/ opinions force me to think critically more."
2) The things that appreciated most in the program	48	49	98.0	"The interactive atmosphere in the classroom, warm up activity also create a good atmosphere" "Instructors always give us many time to share our opinions, to play interactive games and to reflect what we've learnt in the class." "There are a lot of interactions within the students and also with the tutors."
3) Comments on the instructor(s)	29	49	59.2	"Very good activity planning, meaningful and interesting" "Patient and loving; very professional and caring" "The instructors show a strong sense of caring disposition. She presents the content very well with passion. Listening to their sharing is indeed meaningful."
4) Areas for improvement	43	49	87.8	"The program can be taught with more academic way and more example of real cases about leadership." "More discussion with other groups may be better for us to make new friends and gain more great ideas." "More thorough explanations on theories or practical usages."

Table 8. Categorization of descriptors used by the participants to describe the program

Descriptor(s)	Nature of the Response				Total
	Positive	Neutral	Negative	Undecided	
Fun / funny / interesting / enjoyable / exciting / happy / pleasant / satisfying / cheerful / warm / encouraging / active / energetic / optimistic	35				
Beneficial / benefits of personal all round development / helpful / help me to reflect / help me to understand / help to learn myself better / helpful for finding the meaning of my life / helpful in leadership-learning / helpful to let me interact more with my groupmate / helpful to my character development / helpful to my development / helpful to understand others / useful / useful to my social work discipline	20				
Meaningful / meaningful for me to think more / meaningful for my life	10				
Inspiration / inspirational / inspiring / inspiring new ideas / very inspiring in the end	9				
Reflective / have time for reflection / contemplative / provoking / think-provoking / thought provoking	9				
Fruitful/ fruitful program / full contents / diversified	5				
Interactive / interactive design for many sharing / full of interaction / very very very interactive for the activities and the sharing of students	5				
Informational / informative / intensive	4				
Novel / novel and different from normal program / unusual / different from any other programs I took before	4				
Unforgettable / impressing	4				
Better understanding of each other / building friendships	2				
Good learning opportunity / learn much	2				
Turn over a new leaf / morphing	2				
Well-organized	2				
Other positive responses	22				
Development		1			
Challenge		1			
Love		1			
Time-consuming / sometimes a little bit slow in path/ kind of slow			3		
Sometimes boring / boring at the beginning/ tired			3		
A bit aesthetic / too abstract			2		
A little noisy actually			1		
Less knowledge part will be better			1		
Total Count (N):	135	3	10	0	148
Total Count (%):	91.2%	2.0%	6.8%	0.0%	100.0%

Note: Other positive responses included the positive descriptors once or twice.

Table 8 presents the categorization of descriptors that were used by the student participants to express their description of the program. A total of 148 descriptors were found, with 91.2% (n = 135) were positive, 2.0% (n = 3) were neutral, and 6.8% (n = 10) were negative. The two positive responses that most frequently bought up by the participants were “funny / interesting / enjoyable / satisfying” (n = 35) or “beneficial / helpful / useful” (n = 20). Other noticeable and positive descriptors were “meaningful” (n = 10), “inspiring” (n = 9), “reflective” (n = 9), “fruitful” (n = 5), and “interactive” (n = 5). Three neutral descriptors were identified, including “development” (n = 1), “challenge” (n = 1), and “love” (n = 1). Negative descriptors were “time-consuming / slow in path” (n = 3), “boring” (n = 3), “too abstract” (n = 2), “a little noisy” (n = 1), and “less knowledge part will be better” (n = 1).

Table 9. Categorization of the metaphors used by the participants to describe the program

Metaphor(s)	Nature of the Metaphor				Number of Codes Derived from the Metaphor and Its Nature					
	Positive	Neutral	Negative	Undecided	Total	Positive	Neutral	Negative	Undecided	Total
A sour candy / candy / dark chocolate / pizza / smarties	5					12	1	2		
A window / an open door / key / the key to a new door	5					11		1		
Beacon / beacon light / flash light / light	5					5		1		
A novel trip / an enjoyable tour / an excursion to an old place / navigator / crossroad	5					10				
A big green tree / tree / a seed / fertilizer	4					6				
Book / an English book / dictionary	3					4	1	1		
Friend / a big party / a warm home	3					9	1			
A compass / compass in life	2					7				
A ripple / water surface	2					1	1			
Symphony / a comedy	2					6	1			
The head of fleet / a boat	2					3	1			
Other positive responses (e.g., butterfly, gas station, internet, mirror)	9					16	1	3	1	
Total Count (N):	47	0	0	0	47	90	7	8	1	106
Total Count (%):	100.0%	0.0%	0.0%	0.0%	100.0%	84.9%	6.6%	7.6%	0.9%	100.0%

Note: Other positive responses included the positive metaphors reported once or twice.

Table 9 is the categorization of metaphors that were used to describe their views on the program and codes that were derived from those metaphors. There were 47 metaphors identified and 106 meaningful codes derived. All the metaphors were positive in nature (100%), such as “candy / chocolate” (n = 5), “window / key” (n = 5), “beacon light / flashlight” (n = 5), or “tour / excursion” (n = 5). The nature of the metaphors was also categorized into meaningful pieces and codes. The codes derived from those metaphors were 84.9% positive (n = 90), 6.6% neutral (n = 7), 7.6% negative (n = 8), and 0.9% undecided (n = 1). The examples are as follows:

- Candy/chocolate: “The program is sweet and touch and I met a lot of interested persons in several days.”; “If you pay focus, you will find something useful. Like the sweet taste after a bar of dark chocolate.”
- Window/key: “It helps me to understand myself better and reminds the significant values and qualities to become a service leader. And, it encourages me to be more active and brave to speak out your mind in public”; “It’s hard for me to meet so many new friends from Hong Kong (PolyU) and Peking U and have such a long-term trip with them. This course is just like a key and help me open a new door for leadership-learning and so many interesting friends.”
- Light/flashlight: “I learn a lot in this program and the program is very different and it is full of energy and fun.”; “It is the course provide a platform that makes it a lot easier for me to understand it in a new way and it is like a flashlight to make my path clearer and brighter.”
- Tour/excursion: “I know more and think more about myself. I have met some interesting friends I have gained lots of fun through the class and game.”; “I have learned some of the knowledge and skills in this course and I am really thankful to know and recall the knowledge that strengthens my skills that can actually replenish the missing part of the previous course.”

DISCUSSION

Considering the SOAR Youth Leadership Program in the 2017-2018 academic year is a non-credit-bearing program, the enrollment of the participants evidently illustrates the potential upsides and the value of this program. In summary, the findings indicated that the program supported the hypothesis of positive and strong influence in promoting leadership skills and competence for our university students. The findings are consistent with past studies that examined similar program in both scale and sub-scale with good reliability [9, 10].

From the descriptive statistical analyses, the findings presented a significant percentage of the students expressed encouraging responses with the program content, program instructors, and program effectiveness. It reinforced the effectiveness of the SOAR Youth Leadership Program. The results of Pearson’s correlation analyses also supported that there were significant positive correlations among program content, program instructors, program effectiveness, total effectiveness, and overall satisfaction. The findings of both positive

responses and significant positive correlations may further provide evidence of the successful recognition of the program.

The qualitative component of the research echoed the quantitative phase of research, showing positive responses to the program effectiveness. The comments written by the participants indicated that they learned the important elements of a good leader, such as “respect,” “willing to serve,” “empathy,” and “self-reflection.” Many of them expressed the appreciation and described the program as “interactive” rather than the labeling of “inflexible” and “boring” lectures. More than half of the participants also rated positive for the instructors, with the description of “caring” and “patient and loving.” The participants also provided constructive feedback on future planning and implementation, such as “more example of real cases about leadership” and “more thorough explanations on theories or practical usage.” In line with the quantitative phase, subjective outcome evaluation form captured positive evaluation on the effectiveness and satisfaction with the SOAR Youth Leadership Program in the 2017-2018 academic year.

The data derived from personal reflection form also generated qualitative data that worth investigating more in-depth evidence of the effectiveness and outcome of the program. With over 90% of the descriptors given by the participants were categorized as positive responses, the most commonly used descriptors were “funny/interesting” and “beneficial/helpful/useful.” The results were very encouraging and promising. The results also revealed that the program was not only about having a “pleasant” experience but also providing opportunities to think more about “meaningful” for their lives. If looking into the negative descriptors, we could still find a certain percentage of the participants think that the program was “boring” and “slow.” It is important that the program implementation can be frequently reviewed to ensure that the elements of the program are meeting the needs of the students as much as possible and making necessary age- and gender-specific adjustments. Besides, the metaphors used by the participants in this study also showed great similarities in a previous study [19]. The students in both studies described the program as “candy,” opened a “window/door,” guided by “beacon” or “compass,” had a “journey,” fertilized as a “tree,” or read a “book.” The implication of the metaphors resonated with the descriptors.

There are several strengths of the study. First, the results of reliability analyses showed that the internal consistency was high, which indicates a reliable measure of the subjective outcome evaluation form. Second, the study adopted a mixed-method approach, integrating both quantitative and qualitative analysis. The results of using both analyses provided a more detailed view of the participants towards the program and increased reliability and credibility. Third, this is a continuous program that targeted at promoting positive youth development program of the Global Youth Leadership Institute. The results of the SOAR Youth Leadership Program in the 2017-2018 academic year echoed with studies that were examined in previous years. Such consistencies made the effectiveness of this program more conclusive. Finally, the results of the study allowed the program instructors to make corresponding adjustments that were reflected from the participants’ feedback and to contribute to the future planning and implementation of similar programs.

The study also has several limitations. First, as only program instructors, program content and program effectiveness were being evaluated, future studies should consider bringing in other aspects of the program for evaluation, such as administrative arrangement, program engagement, and duration for discussions. Second, the subjective outcome evaluation part can be hugely affected by a person’s subjective impression. Third, the study only examined the

student participants' perceptions of the program. It could be meaningful to also measure the perceptions of other stakeholders, such as program instructors, to provide a more comprehensive understanding of the interactions.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. ABSTRACT

This chapter presents a qualitative evaluation of a credit-bearing, service leadership subject (2016/2017 academic year) at The Hong Kong Polytechnic University. It drew on data collected from three courses carried out in different semesters and venues, and with different degree of intensity. Students (n=76 for the semester 1 course, n=79 for the semester 3 course, n= 64 for the Cambodian summer camp) were invited to reflect on their learning experiences and report their perspectives towards the subject by using three descriptors and one metaphor. Findings demonstrated that the majority of students (more than 80%) evaluated the subject positively with positive perception of their learning experiences. They also perceived this service leadership subject to be effective to enhance their holistic development and nurture service leadership in them.

INTRODUCTION

The contemporary world has gradually shifted from an industrial society that emphasizes manufacturing to a post-industrial society that emphasizes service [1-3]. In Hong Kong, the services sector has occupied the dominant position with a contribution of more than 92% to Hong Kong GDP from 2008 to 2017 [4]. This transformation of society has given rise to an evolving demand in leadership of future generation from directive and autocratic to

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

collaborative and empowering [2]. Only those who acquire good intrapersonal and interpersonal competencies besides their professional skills are able to provide high-quality services and thrive in the service economy [5].

Against this background, there have been a proliferation of theories and models in the field of effective leadership. For example, Conger and his colleagues [6-9] established a model of charismatic leadership, which perceives that leaders win reverence and trust from their followers not just because of the possessed authority and power but their extraordinary character.

Leaders should be a role model for their followers by exhibiting personal charisma such as an inspirational vision and impressive behavior. Greenleaf [10], as one of the pioneers, put forward the concept of servant leadership where he stressed on the power of leadership as a means to serve and empower followers and help them grow. However, Greenleaf's theory was argued by many as vague in definition and lacking of conceptualization and theorization [11]. Similarly, the model of spiritual leadership also underscores qualities of altruistic love, hope, and faith in being a leader. As spiritual leaders, they are expected to create a sense of membership among the team, motivate followers and leaders themselves, and promote the psychological well-being of the whole organization [12, 13]. However, it is argued that this model places less emphasis on the "functional abilities of leaders" [5]. Another influential model is Astin and Astin's Social Change Model [14], which also breaks away from the traditional roles of leadership and aims at using leadership to promote positive social changes. This model comprises eight interdependent core values of leadership, i.e., "consciousness of self, congruence, commitment, collaboration, common purpose, controversy with civility, citizenship and change."

In this model, leadership is perceived as a developmental process rather than a fixed and static position [15]. Studies have been carried out based on this perspective. For example, in a study aiming to examine the effectiveness of a 16-week, credit-bearing leadership course in an American university, the pre- and post-test results showed that college students, regardless of their age and gender, were able to develop more capabilities for socially responsible leaders, even more so for female students in terms of their development in the core values of collaboration and citizenship [16]. In a similar vein, Haber and Komives' [17] quantitative study also confirmed that for university students, participation in college student organization, among others activities, contributed the most to nurturing socially responsible leaders. These studies provided empirical evidence that leadership can be taught and trained at tertiary educational level.

Building on Chinese culture and context, Chung [18] carried forward the concept of service leadership and defined it as "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments." This notion was conceptualized as a 3Cs model that incorporates three major principles, i.e., competence, character, and care, in determining effective service leadership. In this model, the last two principles, character and care, were attached equal or even more importance than the principle of competence. There are seven core beliefs and several distinctive features developed within the model. For example, service leadership believes that everyone has the potential to be a leader, a perspective of which essentially distinguishes from the aforementioned charismatic leadership which underlines an idealized role of a leader [5, 18]. Service leadership also holds the belief that "leadership effectiveness and service satisfaction are dependent on a leader or service provider possessing

relevant situational task competencies plus being judged by superiors, peers, and subordinates as possessing character and exhibiting care” [18]. It underlines traditional leadership skills and competences as well as character and caring disposition. Another note-worthy belief is that service leadership lays emphasis on a balanced attention given to the needs of self, others and systems, and does not necessarily underscore the precedence of others over self [5, 18, 19]. In this sense, these scholars advanced the notion of servant leadership and spiritual leadership to service leadership by acknowledging that self-serving is also a type of service and also cannot be neglected [20]. Self-leadership and self-reflection are also highlighted in the model of service leadership, as they facilitate leaders to constantly monitor the goals they set and motivate themselves to seek continuous improvement in leadership [5, 18]. This notion, however, is not reflected in the model of servant leadership as well [5]. As a service leadership model rooted in Chinese culture, it incorporates Chinese values of Buddhism and Confucianism such as harmony, inner peace, self-reflection, and concern for others [3]. This service leadership, as Chung and Bell [21] argued, is essential to the current service economy of Hong Kong.

Higher education is an important incubator to nurture future leaders through curriculum and projects [14]. However, leadership education has often occupied a subordinate position in universities, and it has been considered inadequate at tertiary education level in reality [22, 23]. In addition, there have been relatively fewer leadership programs that aim to nurture students’ service leadership skills and beliefs oriented to our service-oriented society [2]. In order to meet the high demand of service leaders in Hong Kong society, the Hong Kong Institute of Leadership and Management was founded to assist various stakeholders such as higher educational institutions and government branches to promote service leadership education and practice [24]. Accordingly, the eight universities funded by the University Grants Committee (UGC) have then gradually introduced both credit-bearing and noncredit-bearing service leadership programs to bridge this gap [1]. For these programs, the aforementioned 3Cs model has been established as a theoretical framework for practice [25].

The present study is based on the data collected from one of the Service Leadership subjects entitled “Service Leadership,” which has been carried out in The Hong Kong Polytechnic University (PolyU) since 2012/2013 academic year. This credit-bearing course aims to enhance undergraduate students’ understanding of service leader, cultivate service leadership in them and promote the application of attributes of effective service leadership. To be specific, the intended learning outcomes are shown as below: “a) Understand the contemporary models of leadership with reference to the service sector, including their assertions, strengths and weaknesses; b) Demonstrate understanding of the basic leadership attributes intrinsic to effective service leaders; c) Reflect upon the need for developing the qualities of effective service leaders and their own leadership qualities; d) Appreciate the potential application of knowledge on effective service leadership gained in this subject to oneself” [26].

This subject has been evaluated by previous studies drawing upon both quantitative and qualitative methods, including objective outcome evaluation through pre- and post-tests and qualitative evaluation through analyzing descriptors and metaphors, e.g., Shek and his team’s evaluative work for this subject in 2013/2014 and 2014/2015 academic year respectively [2, 3, 24, 27-30]. Overall, these studies have supported the effectiveness of the subject over the years as well as the positive influence the courses exerted on students. In the objective outcome evaluations, positive changes were found in participants’ service leadership

qualities, positive youth development qualities, and life satisfaction. For example, in a quasi-experimental study that involved both experiential and control groups, Lin and Shek [30] found that participation in this course contributed to great improvement in terms of service leadership attitude and knowledge as well as life satisfaction, which confirmed that service leadership could be trained. With reference to the studies of qualitative evaluation, results showed that the overwhelming majority of students perceived their learning experiences very positively. Many students considered the course with good instrumental value and were “useful” and “helpful” for personal development, while also providing guidance or reference to students within a meaningful and interesting learning environment [e.g., 2, 27]. This subject has been conducted in different semesters, venues (e.g., Xi’an, Beijing, and Cambodia) and with different degrees of intensity. Many of these courses have been evaluated individually with regard to the effectiveness of the course and changes of students after participation. However, there has been a scarcity of research to take an overall perspective and compare the effectiveness of these courses within the same subject. This is the research gap the present study attempts to bridge.

For the present study, the overall dataset was based on three courses under the same subject, “Service Leadership,” which resembled each other in content, syllabus, assessment, and intended learning outcomes, but were carried out in different time and venues. The first course was a regular, 13-week module conducted in the 1st semester of 2016/17 in PolyU. The second was a more intensive module with two lectures given each week and a duration of 6.5 weeks in total in the 3rd semester of the same academic year. The third engaged students in a two-week intensive teaching and learning summer camp in Cambodia with field visits and course attendance in the 3rd semester.

The purpose of this study is to evaluate the overall effectiveness of the subject and compare across the three courses by drawing on a qualitative evaluation. A quantitative evaluation is considered more adequate in generalizing findings, validating assumptions and generating patterns [31]. However, it is often confined to prescribed variables, slicing up realities into discrete pieces [32]. Qualitative evaluation, on the other hand, has the potential to capture the dynamics and complexity of a phenomenon, experiences, live stories and deep emotions, etc., all of which may not be easily reduced to numbers, statistics, and quantification [33]. Therefore, it maintains a depth in understanding complex phenomena and multiple realities such as how respondents make sense of the social world [33, 34]. Second, as it is more open-ended by nature, a qualitative study also has the strength of generating rich data of perspectives and experiences from informants without the risk of neglecting factors that may be critical in explaining the data [35]. Moreover, it is able to provide researchers with a context for interpretation and analysis [34, 36]. Third, a qualitative study often allows more flexibility in design and is able to accommodate different methods such as interviews, observation, and focus group interview [34]. In the present study, we attempted to evaluate the effectiveness of the subject by investigating students’ perceptions, attitudes, and learning experiences in this course. In order to obtain a deeper insight, a qualitative study is considered more appropriate for the present study. To be specific, students were invited to provide written responses containing three descriptors and one metaphor to reflect on their learning experiences and perceptions.

Descriptors, as a type of qualitative description, offer a straightforward way of eliciting data on people’s views and experiences and brings researchers closer to the data [37]. Metaphors can incorporate rationality and imagination and associate cognitive and emotional

domains, allowing us to capture intangible aspects in respondents' experiences that would be more difficult to be otherwise grasped such as feelings and emotions [38-40]. Therefore, it is considered as a useful and complementary method for using descriptors. In addition, metaphors entail "culturally specific" meaning which can attend to feelings and emotions within a context in evaluation [40]. These reasons constitute the rationale of the employment of qualitative evaluation with descriptors and metaphors in the evaluation.

OUR STUDY

As stated previously, the subject "Service Leadership" was conducted in semester 1, 3 and Cambodia summer camp in 2016/2017 academic year. Except the intensity and locations were different, the content of the three courses was the same. At the end of the course, the students who took these three courses were all invited to share their points of view and give feedback to the course by filling the Personal Reflection Form after they accomplished the lectures. To be specific, students were first asked to write down three descriptors (words or phrases) to depict their learning experiences and express their feelings or perceptions about this subject (e.g., helpful, joyful, boring, tough). Second, they were invited to come up with a metaphor (e.g., book, sea, beacon, journey) that can best reflect the characteristics of the subject or their learning experiences, along with a short explanation of why this specific metaphor was selected in order to facilitate interpretation in analysis. Before the data collection, voluntary consent forms were distributed to students to explore their voluntariness of participation. Students were informed about the research project, purpose of data collection, confidentiality of their feedback, and anonymity of their responses. This consent form also made it explicit that participation was entirely voluntary and they could withdraw at any stage in the research. There were 76, 79, 64 questionnaires collected from the course of semester 1, 3, and Cambodian summer camp respectively.

Data Analysis

Two researchers who did not participate in the teaching and data collection were invited to code the responses, which were transcribed from the Personal Reflection Form. With regard to the descriptors, if two words shared a similar meaning, they would be merged into one category (e.g., useful and helpful, interesting and funny). This process of categorization was also applied to metaphors. However, metaphors were also broken down into different meaningful units if the short explanation of the metaphor entailed more than one meaningful unit. For example, a student used the metaphor "fitting room" with an elaboration that "this course provides a lot of idea on what attribute a good service leader should process, it likes the light in the room. This course also provides lots of chance for us to reflection, like mirror in the fitting room." In this case, the interpretation included two meaningful units, i.e., "the light in the room" which was related to the fact that the courses offered them knowledge and guidance, and "mirror in the fitting room" which was concerned with the enhancement of self-reflection and self-awareness. Therefore, this metaphor was divided into two meaningful units.

Then the descriptors, metaphors as well as the derived meaningful units were all classified by their nature into four categories: “positive,” “neutral,” “negative,” and “undecided.” The classification of descriptors was straightforward, while that of metaphors presented a more complex picture. The nature of a metaphor is depended on the nature of the derived meaningful units. For instance, the metaphor of “mother” entails positive meaning in a common sense. However, the student complemented it with an explanation that “sometimes it is really boring during the lecture, but I understand it is helpful and useful in my future.” According to the student, this metaphor included two meaningful units with one negative (“boring”) and one positive (“helpful and useful”). As the positive and negative units shared equal status, the metaphor of “mother” was considered neutral. If positive meaningful units outnumbered negative ones, the metaphor *per se* would be counted as positive, and *vice versa*. In addition, if those meaningful units were perceived as irrelevant, they would be classified into undecided.

Table 1. Categorization of descriptors used by the participants to describe the course in S1 of 2016/2017 academic year

Descriptors	Nature of the Response				Total
	Positive	Neutral	Negative	Undecided	
Helpful to personal growth/Useful subjects/useful to my development	37

Other Neutral responses		6			
Total Count (N):	210	18	0	0	228
Total Count (%):	92.11	7.89	0	0	100

To examine the intra-rater and inter-rater reliabilities and improve validity, 20 descriptors and 20 metaphors were randomly selected from each course respectively. For the intra-rater reliability, the researcher who initially coded the responses recoded the randomly selected items in a different time. For the inter-rater reliability, the researcher who was not involved in the initial coding coded the randomly selected items independently.

FINDINGS

Table 1, 2 and 3 show the codes of descriptors collected from semester 1, semester 3 and Cambodia summer camp in 2016/2017 academic year, as well as their nature and classifications. The results in Table 1 (semester 1) reveal that 210 out of 228 descriptors (92.11%) were positive, and only 18 descriptors (7.89%) were considered neutral. The most frequently mentioned positive descriptors included “helpful/useful (to personal growth),” “interesting/fun,” “inspiring/encourage/motivation/enlightening” and “enjoyable/relaxing/joyful.” The intra-rater percent agreement reached 85% and the inter-rater agreement percentage reached 95%.

The data collected in semester 3 course generated a total of 237 descriptors, which were shown in Table 2. Positive descriptors accounted for 97.05% of all feedback. The percentage of neutral descriptors was 0.84% and negative was 2.11%. The most frequently used three positive descriptors were “helpful/useful/beneficial” “interesting/ fun,” “thought-provoking/educational” and “informative/knowledgeable,” the first three of which were similar to those in semester 1 course. The intra-rater and inter-rater agreements were 90% and 85% respectively.

Total Count (N):	162	22	8	0	192
Total Count (%):	84.38	11.46	4.17	0	100

According to Table 3 (Cambodia summer camp), 84.38% (n=162) of the descriptors were considered as positive, 11.46% (n=22) as neutral, and 4.17% (n=8) as negative. The categories “hot,” “tough,” and “tired” comprised the majority in the negative descriptors. The intra-rater agreement and inter-rater congruence in Cambodia summer camp reached 95% and 90% respectively.

For the metaphors, 76 raw metaphors were collected from semester 1 (see Table 4). As shown in Table 4, 74 (97.37%) metaphors were regarded as positive, such as “light,” “tour/trip/journey,” and “book,” while two metaphors were perceived as neutral. The 76 raw metaphors were broken down into 91 meaningful items, with 89 responses (97.8%) considered positive and two responses (2.2%) considered negative. The first category, mentioned 20 times, was the most frequently mentioned one by students. It indicated that the course had given them directions and guidance in various dimensions in life and helped them grow. Three examples are listed below:

- **Road sign:** “Service leadership, stress on not only personal growth, but also other's growth. It guide you the right way and sense of achievement!”

- **Light:** “It guides me to understand what a leader should be equipped and give me the tips and clues of how to become a successful leader...”
- **Compass in life:** “My programme (Hotel mgt) is something related to service leadership, which is knowledgeable for my career path.”

The second category, mentioned by 15 students, emphasized that the course was informative which nourished them:

- **Tasty burger:** “A burger consists a wide range of ingredients, just like the course consisting different parts of knowledge.”
- **Fertilizer:** “If I were a tree, fertilizer can bring me nutrient to make me grow strong. Like the course inspired me how to be a better person comprehensively.”
- **Buffet:** “This course is very informative that provide a lot of useful information regarding service leadership which enrich my knowledge base.”

The third category was mentioned by 13 students, which contained 18 positive meaningful units. This category implied that the subject was a joyful and memorable experience, which enriched students’ knowledge and broadened their horizons:

- **An enjoyable tour:** “Every teacher just like every different tour guide, leading us to walk around and understand every scenic spot. All the content is interesting as well as helpful.”
- **A wonderful journey:** “I am able to learn more about service leadership and it enriches my horizon.”
- **Wonderful journey:** “In our daily life, we seldom try to study about how we control our emotion, how we care others. In fact, it is a good way for me to review how we treat others appropriately. It is a matter of caring about other's feeling. Try not to just care about own feeling & interest. This is selfish and not a good manner.”

Table 5 presents the 79 raw metaphors collected from the semester 3 course, and 91 derived meaningful units. Among the 79 raw metaphors, 75 were positive, comprising 94.94% of the total. There were two raw metaphors (2.53%) regarded as neutral and 2 (2.53%) as undecided. With regard to the derived meaning units, 84 out of 91 were positive, accounting for 92.31% of the overall units. There were two meaningful units counted as neutral, four as negative, and one as undecided, which accounted for 2.20%, 4.40%, and 1.10% respectively. The first category was mentioned by 19 students. It conveyed the perspective that the course provided direction and guidance to them:

- **A compass in life:** “I learnt a lot of valuable leadership qualities in this course. These elements are important to direct my future road to be a successful leader of self and others.”
- **Torch:** “It help to light up the life and guide the road of future.”
- **A beacon:** “It helps us to find out and understand our goals, and leads us to wherever we want to reach.”

Table 4. Categorization of the metaphors used by the participants to describe the course in S1 of 2016/2017 academic year

Metaphors	Nature of the Metaphor					Number of Codes Derived from the Metaphor and Its Nature				
	Positive	Neutral	Negative	Undecided	Total	Positive	Neutral	Negative	Undecided	Total
Light bulb/Light/Lamp/Compass/Google map/Road sign	20					20

Other positive responses	8					9				
Total Count (N):	74	2	0	0	76	89	0	2	0	91
Total Count (%):	97.37	2.63	0	0	100	97.80	0	2.20	0	100

The next category, which was mentioned by 18 students, reflected the fact that the course was rich in knowledge and useful for their future:

- **Sandwiches:** “It contains many different kind of information and inspired me a lot about my future.”
- **Unforgettable buffet:** “There are so many useful information to put in my mind, it is so full.”
- **Fertile soil:** “The course itself provides us with lots of knowledge which it good for our personal growth just like fertile soil which provides lots of nutrients to the plants for them to grow healthily.”

The third frequent metaphors involved perceptions towards the overall learning experiences. Similar to the semester 1 course, their learning experiences were perceived as interactive, interesting, enjoyable and useful:

- **An interesting journey:** “The knowledge taught in this course are new for me. And it make me have an unforgettable experience.”
- **Life tour:** “It helps us to understand ourselves in different aspects based on the three components and we did self-reflection regarding to our past to our future.”

- **A mysterious tour group:** “I have to experience unknown, yet interesting interactive activities in each lesson with students I'm originally not familiar with, which is similar to that of a tour group.”

Table 5. Categorization of the metaphors used by the participants to describe the course in S3 of 2016/2017 academic year

Metaphors	Nature of the Metaphor					Number of Codes Derived from the Metaphor and Its Nature				
	Positive	Neutral	Negative	Undecided	Total	Positive	Neutral	Negative	Undecided	Total

People in my life		1					1			
Moon				1					1	
Causal relationship				1		1				
Total Count (N):	75	2	0	2	79	84	2	4	1	91
Total Count (%):	94.94	2.53	0	2.53	100	92.31	2.20	4.40	1.10	100

Table 6 demonstrates the 64 raw metaphors and 73 derived meaningful units. 85.94% (n=55) raw metaphors were regarded as positive, while 12.50% (n=8) of metaphors were seen as neutral, and 1.56% (n=1) as negative. With regard to the breakdown of meaningful units, the proportion of positive ones was 87.67% (n=64). For the rest units, five meaningful units were classified as neutral and four as negative, and the proportion is 6.85% and 5.48% respectively. The first category in Table 6 suggested that students achieved personal growth via this course:

- **Tree:** “At the beginning of lecture, we know very little like a small sand seedling, and after having more than 10 lectures. We learnt much more and our mind is like a tree that grows into very strong.”
- **Palm tree:** “I learnt a lot and discovered that everyone has their own strength and we are unique, that everyone is born to be a leader, just like palm tree that grows tall and have a lots of uses.”
- **Bamboo:** “Growth fast. Can withstand in extreme environment. Adapt to change.”

The second category referred to the fact that this course gave them direction, meaning, and depth in life and enabled them to be on the right track:

- **A guidebook:** “It has many principles and practical insights for me to refer to when I meet adversity or lose confidence of myself. I will survive negative self-perception and develop a better-me. This course will guide me.”
- **Light bulb:** “It gave me a direction to become a good service leader so that I can set appropriate goal to improve myself.”
- **Road signs:** “As road signs help drives to find the way and guide them, so does this course.”

Table 6. Categorization of the metaphors used by the participants to describe the course in Cambodia summer camp of 2016/2017 academic year

Metaphors	Nature of the Metaphor					Number of Codes Derived from the Metaphor and Its Nature				
	Positive	Neutral	Negative	Undecided	Total	Positive	Neutral	Negative	Undecided	Total

Other positive responses	12					13				
Oven/Microwave oven		2				2		2		
Tight		1				1		1		
Other neutral responses		5					5			
Urgent			1					1		
Total Count (N):	55	8	1	0	64	64	5	4	0	73
Total Count (%):	85.94	12.50	1.56	0	100	87.67	6.85	5.48	0	100

The third category was mentioned by five students. Similar to the other two courses, students regarded the learning process as a meaningful and joyful journey:

- **Journey:** “The course just gave me some very inspiring experience. All the experience are learning for me and it does on me during my travelling experience.”
- **An enjoy trip:** “I made a lot of friends and visited places that I have never been before. So it is a precious and enjoyable trip.”

- **An enjoyable tour:** “The course is based on the trip to Cambodia and it's really enjoyable to learn with RUPP students and relate what we learned to reality in Cambodia. This course itself is full of knowledge also.”

It is noted that the aforementioned three courses showed high similarity in terms of students' perspectives. Meanwhile, the metaphors perceived as neutral and negative from Cambodia summer camp drew our attention. Examples of neutral and negative metaphors are given as below:

- **Oven:** “The classroom is so hot, just like an oven. Also the teachers are passionate and the students are energetic, thus we are enthusiastic as a heat and warm oven.”
- **Tight:** “It is quite an intensive course. We learnt 13 lecture in less than two weeks. It is quite a lot of knowledge and we also presented on our topic which give us more in-depth understanding.
- **Urgent:** “In the few days, we have finished our 13 lecture and a group presentation, and many course homework, so the time is quiet limit.”

The intra-rater agreement percentage of metaphors for semester 1, semester 3 and Cambodia summer camp is 100%, 95%, and 100% respectively. For inter-rater reliability, the percentage reached 95%, 90%, and 100% respectively. The inter-rater and intra-rater agreement percentages of both descriptors and metaphors suggested high reliability in coding.

A chi-square test was conducted to examine if there was any statistical difference in the nature of feedback between the three courses. To be specific, we divided the descriptors into two major categories, positive and non-positive, the latter of which combines neutral, negative and undecided responses. The result showed that there was a significant difference between the three with respect to the descriptors ($\chi^2 = 22.31$, $p < .05$). A post hoc test was run to explore which cells were significantly different, as χ^2 is an omnibus test. It can be seen from the result that the adjusted residual for positive feedback was -4.3 (smaller than -2.0) for Cambodian summer camp, which indicates that the number of positive responses were significantly smaller than expected. The same procedure applied to metaphors as well. It generated the χ^2 value of 6.42 and p value of .04, which also showed an association between the three courses and the nature of students' feedback. The post hoc test demonstrated that the adjusted residual for the Cambodian summer camp, positive responses was -2.1, and the major difference lay in between Cambodian and semester 1 courses (adjusted residual = 2.3).

DISCUSSION

The present study drew on a qualitative approach to evaluate the effectiveness of the subject “Service Leadership” and its influences on students in order to improve our understanding of students' learning experiences and the subject itself. The qualitative findings demonstrated that the positive feedback was predominant with more than 80% of students in all the three courses evaluating the subject positively. Positive responses reached more than 90% for the semester 1 and 3 courses. The overwhelmingly positive feedback provided

evidence that the well-designed curriculum and projects in higher education are a solid way to improve students' service leadership [14].

According to the written descriptors, the three courses shared the similarity that students considered the subject as useful, helpful or beneficial to them. Other commonly mentioned descriptors include "interesting," "funny" and "enjoyable," which denoted the courses had engaged students in a relaxing, delightful and interactive learning atmosphere; "inspiring," "thought-provoking," "eye-opening" and "heuristic," which expressed that students had broadened their horizons through attending these courses; "informative" and "knowledgeable," which were consonant with one of the objectives of the subject, i.e., imparting essential knowledge in the field of service leadership to students.

As to metaphors, the most frequently reported positive category was related to concepts or instruments that give directions, such as compass, map, beacon, lighthouse, and road sign. Based on students' explanations, these metaphors entail two different meanings: one is that these courses cultivated leadership in them and led them to the right path of how to be a successful service leader, and the other is that these courses directed their way to a successful career path in the future. Another common category shared by the three courses is "tree," "battery," "buffet," "seafood," "bread" and "sandwiches," which all denoted that students had achieved personal development as these courses had provided "nutrients," "fertilizers" or "essential knowledge" for students to grow. They also inspired them and added a competitive advantage to their profiles. In this sense, this category echoes the written descriptors such as "informative/knowledgeable" and "inspiring/thought-provoking." The third noticeable broad category shared by the three cohorts of students is that the learning experiences were an "enjoyable tour," "interesting journey" or a "party," which demonstrated that this subject was featured with an active and relaxing learning mode. Among the overwhelmingly positive feedback, there were several negative comments, especially in the Cambodian summer course such as "hot," "oven," "tight," and "tough." Their further elaborations of the metaphors showed that the negative meaning units were often associated with the intensive teaching and learning modes and students' inability to adapt to the hot climate in Cambodia during a short period of time. Despite several negative comments, the overall findings demonstrated the effectiveness of the subject "Service Leadership" in promoting students' holistic development and nurturing service leadership qualities. Students thought very high of this subject and of their learning experiences. The positive responses are consistent with previous studies [e.g., 27, 41], which centered around the instrumental and practical value of this subject, positive emotions emerged in this learning experiences, interesting and interactive teaching and learning styles, rich content, and personal development in competence, character, and caring disposition. In a sense, students' comments also echo that of previous objective outcomes evaluation [e.g., 2, 24] that participation in this subject facilitated personal growth and helped them thrive as it equipped them with necessary knowledge in service leadership and promoted caring disposition such as "how to treat others appropriately," and thus contributed to development in service leadership qualities and positive youth qualities.

In addition, this study adds to the literature by demonstrating the values of using descriptors and metaphors in evaluating a program. First, descriptors and metaphors provide a context for readers, and hence can facilitate interpretation and secondary analysis [40]. Second, metaphors are valuable in exploring informants' lived experiences as it attends to the depth of emotions and other intangible aspects in their lives [38, 42]. Third, compared with interviews or ethnographic observation, using descriptors and metaphors is efficient in

evaluating the effectiveness of a program, especially when dealing with large cohorts of informants. It allows them to encapsulate their learning experiences and complex emotions into small linguistic units.

Despite the overall encouraging and positive findings, there are several limitations of this study. Firstly, the efficiency of using descriptors and metaphors may bring about omission or misrepresentation in interpretation and analysis, as this method only allows a limited extent of elaboration from informants. For example, students described the course as “useful” or “helpful.” Researchers nonetheless had limited understanding that in what ways the course was beneficial to those students without their further elaboration. In order to reach a more comprehensive understanding of students’ learning experiences, in-depth interviews or focus group interviews should be involved in future studies. Second, as it was not designed as a pre- and post-test quantitative evaluation, the present study generated limited data on understanding in what aspects and to what extent students grew through attending the course. Despite the aforementioned limitations, the present study provides solid empirical evidence that the subject “Service Leadership” is effective in promoting students’ knowledge and competence in service leadership, and contributes to their personal growth.

Chapter 130

A QUALITATIVE EVALUATION OF A SERVICE LEADERSHIP SUBJECT IN A HIGHER EDUCATIONAL INSTITUTION IN HONG KONG

and Jiaxi Zhang, MA***

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

The chapter represents an attempt to evaluate the subject “Service Leadership” which has been conducted at The Hong Kong Polytechnic University as a credit-bearing subject. The dataset was collected from three courses under the subject in 2017/2018 academic year, which included 207 undergraduate participants in total (n=87 were from the Semester 1 subject, n=89 were from the Semester 3 subject, and n=31 were from the Cambodian summer school). By analysing students’ written feedback of descriptors and metaphors, researchers found that participation in this subject fostered students’ development in different areas including self-reflection, leadership competencies, moral characters as well as caring disposition, and hence equipped them to become qualified leaders in the future. This study also provides convincing evidence that it is important for higher educational institutions to incorporate service leadership education in their curricula.

INTRODUCTION

Service industries have contributed greatly to the development of many societies in the past decades. The remarkable transformation from a manufacturing economy to a service-based economy has led to a shift of the desired qualities of employees. In a product-based

* Corresponding Author’s Email: daniel.shek@polyu.edu.hk.

industry, the crucial attributes of employees were following instructions and conducting routine work by merely using their technical skills [1]. In sharp contrast, the critical requirement for employees in a service-based economy is to hone their soft skills (e.g., leadership, integrity, resilience, teamwork, and interpersonal skills) [2]. While in a manufacturing economy, leadership is often associated with centralised authority and personal power, a service industry calls for decentralised power, flexibility, and mutual influence [3]. Accordingly, there has been increased attention among scholars given to the shift of desired attributes of leadership and the application of new leadership models for university students since the 1990s [4].

Among the many leadership models, two widely recognized models which are highly relevant to the service-oriented economy are “servant leadership model” [5, 6] and “transformational leadership model” [7]. Servant leadership model proposes a servant-first philosophy in which servant leaders emphasize the needs of their followers, distinguishing itself from the conventional notion of leadership that highlights authority and dictation with top-down hierarchy [5, 6]. This concept encourages leaders to focus on the development and benefits of followers and the groups to which they belong [6]. Furthermore, Gregory and his colleagues [8] asserted that the servant leadership model offered the conceptual framework which can incorporate different leadership and facilitate empirical research. With regard to transformational leadership, Bass and Avolio [9] proposed four general components in leadership behaviours, i.e., “Idealized Influence, Inspirational Motivation, Individualized Consideration, and Intellectual Stimulation.” Building on and refining the previous theories, Kouzes and Posner [7] proposed their transformational leadership model, which presents five core practices in motivating followers and establishing effective leadership, i.e., “Model the Way, Inspire a Shared Vision, Challenge the Process, Enable Others to Act, and Encourage the Heart.” It is also a framework based on a large number of empirical case studies and surveys. For decades, the five elements of exemplary leadership have been verified by scholars to be positively correlated to the effectiveness of leadership, organizational commitment and work satisfaction [7]. They also hold the belief that not just great people can acquire exemplary leadership and mobilize others, but everyone can achieve that by receiving training and applying these practices. It is noted that despite their prevalence in service-oriented economies, they were developed in a Western context and rooted in Western culture, and therefore it is impractical to apply them in Hong Kong [10].

In answer to the call for a leadership model rooted in a Chinese context, Chung [11] and scholars from the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) developed a service leadership model with the aim of promoting service leadership education at tertiary level in Hong Kong and providing advice and assistance to stakeholders such as government agencies and business communities. In this model, service leadership is defined as “ethically satisfying others needs by consistently providing quality personal service to everyone comes into contact with, including one’s self, others, communities, systems, and environments,” in which the core concept of leadership is essentially about service [11]. There are several core beliefs highlighted in this model. For example, the service leadership model upholds the belief that every individual is valuable with the potential of becoming a qualified leader [12]. Everyone also has opportunities to practice his or her leadership on a daily basis from self-serving improvement opportunities to more complicated service encounters. In addition, this model accents self-serving and self-management, a process during which people can improve their competences and other qualities, and are hence better

prepared to the needs of self and others [12]. Besides the core beliefs, HKI-SLAM also proposed a 3Cs model in which leadership competence, moral character, and caring disposition are introduced as the three major components in determining the effectiveness of service leadership [13]. This model distinguishes it from traditional leadership models that either highlight partial leadership skills that are primarily “related to individual achievement, sheer productivity and positional authority,” or claim that merely elites can achieve a good leadership [14]. Moreover, it is a leadership model which incorporates Chinese concepts and philosophies, including Confucianism, Daoism, and Buddhism. It reflects the Chinese culture and traditional values such as “harmony, righteousness, honesty, loyalty, benevolence and empathy” [4]. In general, this model is considered as a framework oriented to the service economy specifically under Hong Kong socioeconomic conditions [15].

Equivalent to the transformational leadership model, service leadership model cherishes a value that leadership can be acquired and not attributes one is congenital. However, the transformational leadership model mainly stresses on collective value and shared vision of groups and organizations. As a follower-centric model, it focuses on the leaders’ abilities to nurture, influence and mobilize followers but fails to place equal emphasis on self-management and self-improvement [12]. It is in sharp contrast to service leadership in which balanced consideration is given to self, others and the system [12]. Furthermore, transformational leadership primarily underlines high morality and personal charisma. Service leadership, on the contrary, pays significant attention to the comprehensive development of moral character, caring disposition as well as different leadership competencies in building up effective service leadership. A service leader shares several qualities in practice with a servant leader, such as the emphasis placed on service instead of autocratic and authoritative leadership, and on high moral characters and caring disposition. However, in comparison to the servant leadership model, it is firmly believed that service leadership model does not promote serving others and community at the expense of self-interest; instead, it includes self in service orientation [12]. In addition, it gives due attention to functional competencies and practical skills in being an effective service leader, which is not fully addressed in the servant leadership model [12].

In order to promote service leadership education in Hong Kong, the Service Leadership Initiative (SLI) was launched by the Victor and William Fung Foundation. Total eight higher educational institutions funded by the University Grants Committee (UGC), including The Hong Kong Polytechnic University, joined in this initiative and integrated the service leadership model in their curricula. Based on this framework, a credit-bearing subject entitled “Service Leadership” has been introduced to undergraduates at PolyU. In the 2012/13 academic year, a 2-credit service leadership subject was offered to students under the 3-year degree program at the initial stage. Since the 2014/15 academic year, 3-credit subject has been introduced to students studying in the 4-year degree program [16]. Its objectives include “1) understanding and integration of theories and concepts on service leadership, particularly the key propositions, core beliefs, and curriculum content strands of the HKI-SLAM conceptual framework; 2) acquisition of skills intrinsic to service leadership; 3) formation of strong identification with the attitudes and values emphasized in service leadership; and 4) recognition of the importance of service leadership to the development and wellness of oneself, other people and the whole society, particularly recognize the connection of learning in the subject to one’s own life” [17]. This subject highlights experiential learning, reflective learning and collaborative learning, which includes methodologies of lecturing, group work,

papers assignments with reflection, and experiential learning sessions [18]. It aims to facilitate students' understanding of contemporary models of leadership as well as the attributes of service leadership, nurture effective service leadership qualities in students, and encourage critical reflection and application of theories and knowledge from classroom to real life [18].

To examine the efficacy of service leadership course and improve teaching and learning experiences accordingly, evaluation is crucial [19]. In general, both quantitative and qualitative approaches have their own advantages. Shek and Sun [20] argued that a quantitative evaluation could utilize numerical data and statistics to validate assumptions, quantify perceptions, and measure at multiple time points effectively. Particularly, the use of quantitative method has the advantages of generalizing investigation results to "a larger population based on a representative sample, determination of causal relationship between given conditions and program outcomes, independence of results from investigator's standpoint, and standardized instruments and procedures that can be repeated in replication studies conducted by other researchers" [17]. It is also regarded as the mainstream methodology in social science research and has been used in the previous evaluation of the subject "Service Leadership" [21-23]. For instance, in a quasi-experimental study [21], the pretest-posttest results indicated that there was a greater enhancement for students who joined the course than those who did not, with regard to knowledge and attitudes related to service leadership, as well as life satisfaction.

Nonetheless, quantitative approach is criticized as less adequate in exploring subjective experiences and life stories as well as understanding in-depth meanings of participants in social and behavioral studies [24]. Qualitative methods can, therefore, capture detailed information with openness in eliciting data and at the same time maintain depth in analysis, objectives of which may be more difficult to achieve for structured methods [24, 25]. For an in-depth evaluation of program effectiveness, a qualitative study is considered more capable, as it contributes to the understanding of informants' experiences, perspectives and feelings in the learning process [26]. In this study, therefore, a qualitative method was selected to evaluate the effectiveness of the "Service Leadership" subject from the perspective of university students in Hong Kong. Notably, qualitative evaluation can also incorporate many approaches, such as "direct observation, focus group interview, and written reflections" [24, 25]. The qualitative evaluation has been adopted in previous studies. For instance, in a series of studies (e.g., 1, 4), Shek and his team provided convincing qualitative evidence of the positive influence this subject exerted on participating students by analyzing their written feedback.

In this study, we included a total of 207 students who attended the "Service Leadership" during the academic year of 2017/2018. We elicited their written responses by inviting them to give three descriptors and a metaphor to describe their learning experiences in and attitudes towards the course. Meanwhile, they were invited to elaborate with an explanation for their selected metaphors. The written descriptors allowed students to express their opinions in a straightforward and open manner. It also offered researchers a quick view of students' perceptions facilitated our identification of the nature of comments. The use of metaphor is an efficient way to understand some "emotionally difficult concepts" and explore intangible concepts [27]. According to Ma and her colleagues [28], conceptual metaphor theory is a frequently used method in evaluation research. A conceptual metaphor comprises two domains: the target (e.g., perceptions towards the course in the present study), and the source

(e.g., “beacon” or “journey” used by students in the present study) [29]. The target domain, as known as the conceptual domain, is what researchers pay particular attention to, while the source domain is the metaphorical expression to represent or describe the domain. Through pairing the target and the source, metaphors serve as a conceptual correspondence that sheds lights on abstract thinking and its connections to subjective experiences [28, 29]. As the present study mainly explores students’ perspectives and learning experiences to evaluate the effectiveness of the course, using written responses of metaphors and descriptors is considered adequate to reach our research objectives.

OUR STUDY

The purpose of the presented study was to evaluate the quality and effectiveness of the subject “Service Leadership” in the 2017/2018 academic year. This subject was carried out in Semester 1 and 3 in Hong Kong, and in the summer term in Cambodia. The Semester 1 subject was a regular module course with one lecture weekly and a duration of 13 weeks all-inclusively. The Semester 3 subject was with modest intensity, where two lectures were given each week during a period of 6.5 weeks. The Cambodia summer school was a two-week intensive module, which requested students to conduct field visits and attend classes in Cambodia. Students who participated in those three subjects were all invited to describe their subjective experiences in the program. They were first requested to use three concise words or phrases (i.e. descriptors) as their personal reflection of the program. They were also required to use a metaphor to give a written account of their perception towards the course with a brief elaboration. The student consent form was collected before the data collection. There is a total of 87 students in semester 1, 89 students in semester 3, and 31 students in Cambodia Summer School participated in this research.

Data Analyses

The coding of descriptors and metaphors was conducted by two independent researchers who were not associated in either lecturing the course or collecting data. To start with, the written descriptors were classified into four categories, defined by their nature of positive, neutral, negative and undecided. The coding of metaphor is more complex as a metaphor can entail more than one meaningful unit. By way of illustration, there was a student using “water” as the metaphor to describe this course with the interpretation that “the class seems simple or even boring, but when you look back, you will realize that it is so important to build up our character and leadership. Just like water, simple but important.” It was coded into two meaningful units. The first one is a negative comment which indicated the course was boring on the surface, while the second is about the benefits and development of the student during the course. As the negative and positive units share equal status in quantity, this metaphor was coded as neutral. If the metaphor was considered irrelevant to the context, it would be categorized into “undecided.” For descriptors and metaphors respectively, similar meanings were grouped into the same category. In order to examine intra-rater reliability in a reliable manner, the two research fellows randomly selected 20 descriptors and 20 metaphors from

each semester and coded them in a different time. These 20 descriptors and 20 metaphors were exchanged to and crosschecked by the other researcher to examine the inter-rater reliability.

Table 1. Categorization of descriptors used by the participants to describe the course in Semester 1 (HK) of the academic year of 2017/2018

Descriptions	Nature of the Response				Total

Total Count (N):	250	8	3	0	261
Total Count (%):	95.79	3.07	1.15	0	100

FINDINGS

Tables 1, 2 and 3 show the descriptors of Semester 1, Semester 3 and Cambodia summer school respectively, together with the categories and the nature of them. As shown in Table 1, 250 out of 261 descriptors (95.79%) were positive, eight descriptors (3.07%) were neutral and three (1.15%) were negative. The descriptors with the same meanings were merged. Six categories were most frequently mentioned by students from semester 1, i.e., “fun/funny/interesting,” “inspiring/thought-provoking,” “useful,” “meaningful,” “happy/joyful/enjoyable” and “interactive.” Eight descriptors, i.e., “social epitome,” “academic,” “information,” “listening,” “lollipop,” “mystery,” and “self, others, system,” were regarded as neutral, while three were seen as negative, i.e., “loss of direction,” “slightly perplexed” and “regret.” Both the intra-rater reliability and inter-rater reliability reached 100%, indicating a high consistency in coding.

Table 2. Categorization of descriptors used by the participants to describe the course in Semester 3 (HK) of the academic year of 2017/2018

Vague			1		
Total Count (N):	245	12	10	0	267
Total Count (%):	91.76	4.50	3.75	0	100

Similar results can be found in Table 2, where 245 out of 267 descriptors (91.76%) were categorized as positive, such as “fun/funny/interesting,” “helpful/beneficial,” “inspiring/thought-provoking” and “informative.” 12 descriptors (4.50%) were considered neutral in nature, such as “hungry,” “long/long-duration” and “abstract,” and 10 (3.75%) as negative, such as “boring” and “too many activities in class.” Both the calculated intra-rater and inter-rater agreement percentages attained 95%, which indicated that the codes were all highly consistent.

Table 3 displays the results of the descriptors from Cambodia summer school. It shows that 85 out of 93 descriptors (91.40%) were positive. The most commonly mentioned categories were “fun/interesting,” “helpful,” “informative” and “meaningful/profound,” which is similar to that of Semester 1 and 3 courses. Only four neutral descriptors (4.3%) and four negative descriptors (4.3%) were reported. The inter-rater reliability was 100% and the intra-rater reliability was 95%.

Total Count (%):	96.77	0	0	3.23	100	96.97	0	0	3.03	100

Tables 4, 5 and 6 show the codes of metaphors of the three courses as well as the categories and nature of them respectively. As can be seen from table 4, among the 87 metaphors, 82 (94.25%) were coded as positive, only four (4.6%) as neutral and one (1.15%) as undecided. The 87 metaphors were broken down into 100 meaningful units, in which 95.0% (n=95) were positive in nature, 1.0% (n=1) was neutral, 3.0% (n=3) were negative and 1.0%

(n=1) was undecided. The metaphors with similar meanings were categorized into the same group. For example, the “workshop” and “forum” that proposed by two students both implied interactive learning modes according to their explanations, therefore these two metaphors were considered as under the same category.

All categories were listed according to the frequency mentioned by students. The first category, that was recognized by 24 students, all indicated that this course of study gave them direction and guidance. Some examples are listed below:

- **Light:** “It leads us into a right way, and it lights up my career path.”
- **Compass:** “It gives me different ideas of service leadership, and it helps me to develop. Also, it shows the way to become a successful service leader.”
- **Map:** “It provides guidance to service leadership. It shows a clear path for my future leadership execution.”

The second category was pointed out by 9 students, which mainly suggested that it had been an enjoyable and memorable journey for them to attend the “Service Leadership.” During the process, they were able to acquire new knowledge and develop themselves. For instance:

- **Enjoyable tour:** “This course is very interested for learning how to become a successful leader and also helpful for my career and study after studying in this course.”
- **An interesting trip:** “I have learnt something more in each lecture. For example, I have learnt the basic concept of service leadership: $E=MC^2$. And the learning process was interesting.”
- **An inspiring journey:** “It would be like a journey to extremely new things, and concepts are really interesting and inspiring for me. I would be able to grow and learn through the journey.”

Other frequently mentioned positive categories include “camping/workshop” (n=6), “book/dictionary” (n = 6), and “tree” (n = 6). There were four neutral metaphors (i.e., “a boat,” “organization,” “people get along” and “poet”) and one undecided metaphor “ripples.” The intra-reliability was 95% while the inter-reliability was 100%.

Similar positive results of Semester 3 course can be found in table 5, where 82 (92.13%) out of 89 metaphors were positive, five (5.62%) were neutral, one (1.12%) was negative and one (1.12%) was undecided. In addition, these 89 metaphors were coded into 103 meaningful units, among which 91.26% (n=94) were perceived positive, 2.91% (n=3) were neutral, 4.85% (n=5) were negative and 0.97% (n=1) was undecided.

According to the frequency, topping the list of positive categories is “light/compass/travel guide/map,” which was stated by 16 students. This category expressed that the course gave them direction and guidance. Below are some examples of students’ illustrations:

- **Light:** “Bring me new information to explore the dark future.”
- **Compass:** “This course helps me reflect my position in life and provides guidelines that lead to successful leadership.”
- **Beacon:** “This course guides my direction of my future life like what beacon does in the sea.”

The second category, which chiefly implied that the course covered meaningful knowledge and sufficient information, was mentioned by 10 students. Three examples are listed as below:

- **Book:** “The course contains a lot of knowledge and methodology of the development and concept of service leadership.”
- **Encyclopedia:** “Meaningful, full of knowledge.”
- **Reading a meaningful book:** “Learnt a lot in the course.”

There are four neural metaphors, (i.e., “detective game,” “durian,” “healthy food” and “mixer”) stated by students. One negative metaphor, “beet,” and one undecided metaphor, “baby,” were recorded. Both the intra-agreement percentage and inter-agreement percentage calculated from these metaphors were 95%, which indicated high reliability.

For the metaphors used in the Cambodia summer school (see table 6), 30 (96.77%) out of 31 were positive and only one (3.23%) was considered undecided. With regard to the meaningful units, 32 (96.97%) were regarded as positive and one (3.03%) as undecided. The first frequently mentioned category, which was acknowledged by seven students, conveyed that the course gave them direction and guidance to develop their service leadership, bringing meanings to their life. Below are the examples of students’ explanations:

- **Light bulb:** “The course is helpful to my development and is meaningful to my life, just like a light bulb lighting my future.”
- **Compass:** “It leads me to the way to provide great service to others in the future, especially I am a nurse to be.”
- **A map:** “It guides us to different places and helps me to know more about service leadership.”

The second category, which was appreciated by five students, revealed that the course helped them to reflect and understand themselves in a better way. Three examples are shown below:

- **A mirror:** “I can reflect myself for “who am I” and “what I want to be” seriously during the lesson.”
- **Mirror:** “It helps me to do reflections frequently to understand more about myself.”
- **Mirror:** “I can know more about myself through several reflective activities.”

The only undecided metaphor was “my attention.” Both the intra-reliability and inter-reliability reached 100%, indicating a very high degree of consistency in coding.

DISCUSSION

The present study evaluated the quality and effectiveness of the subject entitled “Service Leadership” in the academic year of 2017/18. A qualitative evaluation methodology was used to reach an insightful comprehension of students’ perceptions and feelings towards the subject. Both intra-rater and inter-rater reliability of the descriptors and metaphors were all equal or greater than 95%, demonstrating that the qualitative findings are highly reliable.

The reported findings indicate that the subject was effective in nurturing service leadership of university students in Hong Kong. For the descriptors, the responses were dominantly coded as positive in nature as more than 90% of the students expressing their positive views of the course (95.79% in Semester 1, 91.76% in Semester 3, and 91.40% in Cambodia summer school). The positive views from the three courses have several features in common. According to the descriptors, this subject was positively depicted as “interesting” and “funny,” suggesting students had been engaged in a joyful atmosphere of learning. Another frequently mentioned category is “inspiring” and “thought-provoking,” which indicated this subject stimulated students’ deeper thoughts and vision. A large proportion of students across the three courses also used “helpful,” “useful,” “meaningful,” and “beneficial,” which manifested that students largely appreciated the value of utility in “Service Leadership” education. Many students used “informative” as a descriptor to convey that the subject had offered them useful and rich information and was helpful and useful for their future development.

Similarly, over 90% (94.25% in Semester 1, 92.13% in Semester 3, and 96.77% in Semester 3 Cambodia) metaphors were positively used by students to reflect their perception and experience of the learning process. The most frequently mentioned category of positive metaphor resembled each other between the three courses, i.e. “compass,” “beacon,” “map” and “light.” According to the written metaphors, the service leadership subject was regarded as an effective tool to bring meanings to life and to provide direction and guidance for students’ future development and how to effectively be a qualified service leader. To elaborate, one student pointed out that the course could give him/her different concepts of service leadership, showing him/her the way to become a successful leader in future. This category of metaphor demonstrated that one of the essential objectives of service leadership subject, i.e. “recognizing the importance of service leadership to the development and wellness of oneself, other people and the whole society, particularly recognize the connection of learning in the subject to one’s own life” [17], were achieved to a great extent.

The second most frequently mentioned metaphors were associated with joyfulness, which expressed the positive emotions of students. Students used metaphorical expressions such as “inspiring journey,” “interesting trip” or “tour” to reflect their enjoyable learning experiences, which are resonant with the aforementioned written descriptors, such as “happy,” “interesting,” “enjoyable,” and “relaxing. The concordance between descriptors and metaphors implied that the service leadership subject provided them an interesting and enjoyable learning experience where they also learnt and developed. It was also suggested by the explanations of metaphors that this subject has engaged students in interactive games and experiential learning activities, in which students could learn in a practical way. It reflected the highlighted features of teaching and learning methodology in this subject [17]. Students also used metaphors such as “book,” “Wikipedia,” and “encyclopedia” to describe the

subject, as they thought it provided useful and interesting information in the scope of “Service Leadership.”

Additionally, several participants revealed that the service leadership subject promoted reflective learning. It manifested itself in the use of “reflective” as the descriptors and “mirror” as the metaphors. According to students’ elaboration, they had learnt to have constant and deeper reflection and were able to achieve a better understanding of themselves. For example, a student perceived this course as a “mirror” as he/she could understand who he/she is and what he/she “wants to be seriously during the lesson.” Researchers discovered that reflective learning is one of the effective learning methods for students. It was believed that critical reflection contributes to their avoidance of premature cognitive mindset, development of accurate perceptions, improvement of flexibility, and enhancement of creativity [30]. Asserted by Begley and Branson [31], the use of self-reflection is an essential step that can foster leaders’ moral characters in their leadership development. Therefore, promoting students’ reflective learning has been one of the foci of attention in service leadership subject implementation [1]. This view is also shown in the Subject Descriptive Form of the subject. These results suggest that reflective learning was well perceived by participating students. Besides, the findings indicated that participation in service leadership program was a solid way to promote self-reflection.

Despite the remarkable positive responses towards the course, there was still dissatisfaction expressed by a few students. For example, several negative descriptors (1.15% in Semester 1, 3.75% in Semester 3, and 4.30% in Semester 3 Cambodia) were found across three different classes. Taking the class in Semester 3 in Hong Kong as an example, four students described the course using “boring,” and the other two interpreted it as “too many activities in class.” Although the negative perceptions were in minority, future evaluation studies such as focus group interviews can be conducted to understand negative views towards the subject and how to improve students’ learning experiences.

Overall, the findings in the current study are consistent with previous studies [e.g., 1, 4, 17] in that there were overwhelmingly positive responses in the form of both descriptors and metaphors. For the descriptors, several categories such as “helpful/beneficial,” “useful,” “inspiring/thought-provoking,” “fun/funny/interesting,” and “happy/joyful/enjoyable” repeatedly appeared across the past few years. For the metaphors, several objects like “light/light bulb/lighted candle/compass/map,” “(interesting/enjoyable/delightful) travel/journey/trip/tour,” and “mirror” were also commonly observed in the past years. The prevalence of similar positive feedback across years demonstrates that the subject of Service Leadership has been able to cultivate holistic development and leadership qualities in students. The overwhelming positive findings are also consistent with the findings from “objective outcome evaluation” where it relatively demonstrated a certain positive development for students who completed the subject [3].

The significant implications of the present study are as follows. First, our findings demonstrated that “Service Leadership” fostered students’ development in different areas including self-reflection, leadership competencies, moral character as well as caring disposition, and hence equipped them to become qualified leaders in the future. As the ideology of service leadership is well aligned with the post-industrial paradigm of leadership, university students were able to develop their leadership qualities oriented to the service society. Therefore, this study suggests that it is essential for the university to incorporate service leadership education in its curriculum. It confirms Hastings and Sunderman’s [32]

viewpoints that higher education institutes and their educators should uphold the responsibility to nurture socially effective leaders.

Regarding the evaluation of subject effectiveness, the current study demonstrates several advantages of using descriptors and metaphor in a qualitative evaluation. From the analytical process, the use of descriptors allows researchers to identify the features and nature of the subjective experiences efficiently. Metaphors also enable participants to efficiently encapsulate intangible meanings or abstract ideas into a concrete image or representation. It also facilitates researchers' interpretation of participants' subjective experiences and thoughts. As Shek, Siu and Merrick [17] put it, "using metaphor helps the students to express their mental representations regarding the effectiveness of the course, which at the same time allows researchers to access into students' cognitive representation." Of course, there is a need to assess the reliability of the coding and interpretations involved. According to Shek, Tang and Han [33], using intra- and inter-rater reliability procedures would be helpful.

Despite the inspiring and promising findings, several limitations are noted. Firstly, the present study only focused on addressing the perceived effectiveness of participating students. The evaluation of the subject was therefore significantly based on subjective but not objective approaches. Therefore, it is necessary to combine the current study with an additional assessment such as observation. However, as it is mentioned above, quantitative and qualitative evaluation findings in the existing literature conducted by the research team basically complement each other. Secondly, the data collection conducted at a single point of time for each class. It is regarded less adequate than approaches such as pre- and post-test which can evaluate the course at different points of time (i.e., at the outset and the end of the semester) and investigate students' behavioral changes after taking the course. Thirdly, as only limited explanations were obtained, it is challenging to ascertain the underlying reasons behind students' positive comments. For instance, despite the fact that the majority of students perceived the course as "useful," research staff could not fully understand how the course benefited the students. To obtain a more inclusive and comprehensive understanding of students' perception, in-depth interviews such as individual or focus group interviews could be incorporated into future researches. Nonetheless, the findings of this qualitative study demonstrate promising results for the effectiveness of the subject "Service Leadership" and the positive developments of participating students during the 2017/18 academic year.

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

In view of the emergence of service economies in the global context, it is important to promote service leadership education in universities. In Hong Kong, many studies showed that service leadership education could successfully promote university students' service leadership attributes (competence, character, and care) and foster their well-being. To benefit more students and enrich their learning experiences, there is a need to develop blended learning tools in addition to traditional classroom-based service leadership education in Hong Kong. In this article, we outline the development of a leadership subject in blended-learning mode. Preliminary findings suggest that participating students generally showed positive perceptions of the course, instructors, and course benefits. Besides, students' service leadership qualities and well-being showed positive changes after completing the course. Limitations of the evaluation findings and challenges of implementing a blended service leadership course are discussed.

INTRODUCTION

In the 21st century, one of the most significant challenges faced by higher education is how to incorporate advanced technology to facilitate lifelong learning and to increase student

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

achievement and success [1]. On the one hand, information technology has penetrated almost every sphere of human life and greatly reshaped human lifestyle including their learning mode and behavior. On the other hand, there are increasingly diversified profiles of university students in terms of different cultures, regions, socioeconomic backgrounds, personalities, learning motivation, and learning styles [2]. Both aspects have raised significant challenges to traditional face-to-face teaching mode, which has been criticized for its weak capability to promote higher-order thinking, active learning, and collaborative learning [2]. In response to these challenges, blended learning as a new and innovative teaching and learning mode has been increasingly adopted for its potential in learning transformation [3].

Generally speaking, blended learning refers to a hybrid mode of learning based on well-conceived and effective integration/combination of traditional face-to-face classroom learning and electronic learning [1, 4, 5]. The integration/combination implies a comprehensive transformation and redesign of traditional teaching in which course instruction includes both face-to-face and online instructions and the time for classroom teaching is reduced [6]. Through this integration, teachers could utilize both classroom and online teaching techniques to engage students in active learning. In blended learning, the nature of classroom teaching is a place for students to present, interact, share, discuss, and debate [6, 7]. In the classroom setting, students can consolidate and deepen their online learning results. Classroom teaching also plays a vital role in promoting students' social interactions and bonds establishment. In addition, classroom teaching provides instant support and feedback, which is often seen as an advantage compared to online learning [8]. Therefore, blended learning aims to "join the best features of in-class teaching with the best features of online learning to promote active, self-directed learning opportunities for students" [6].

Garrison and Kanuka [1] argued that blended learning could foster "a community of inquiry" through "multiple forms of communication" including face-to-face and online communication. This community of inquiry involves both cognitive and social functioning through interactive dialogues. During the process, students develop critical and reflective thinking, which implies that they have engaged in deep and active learning. In blended learning courses, learners could access and learn knowledge and information with no restriction of time and space [2]. They have higher autonomy to decide and schedule their own learning pace [9]. Students can be "together" physically through face-to-face classroom teaching and virtually through synchronized online learning; they can also be "apart" through asynchronous online learning [10]. All these features make students' learning highly flexible, which is essential for maximizing their learning achievements [10]. Furthermore, blended learning provides access to a large body of students with diversified backgrounds, such as students having commuting difficulties, owning part-time jobs, or having financial concerns, whose learning needs could not be easily met by traditional classroom teaching [8].

A growing body of empirical studies has focused on the impacts and effectiveness of blended learning courses [11, 12]. Some scholars found that well-designed blended learning courses could facilitate quality interactions among students and between students and teachers [13], increase student engagement [14], enhance learning satisfaction [8, 15], promote knowledge acquisition and learning achievement [16, 17]. Some studies also identified factors influencing the effectiveness of blended learning, including student engagement and perceptions about these courses [8], teacher support [18], and student learning styles and maturity [19]. Furthermore, a few studies outlined potential challenges of implementing blended learning courses in higher education institutions, such as a lack of new pedagogical

and technological skills among staff, insufficient learner support throughout the learning process, conventional conception, and staff resistance to change [6, 20].

Overall speaking, blended learning can be regarded as an irresistible trend in higher education due to its potential to improve student learning. With the continuous advancement of information technology, the inclusion of blended learning is increasing. However, Halverson and colleagues [3] claimed that one research gap was that a large body of existing work primarily focused on theoretical discussion on definitions and models while there were relatively limited empirical studies. Some scholars further discussed the limitations of blended learning at institutional level (e.g., complexity of its management and demanding for advanced learning management system) and student level (e.g., requirement of becoming self-directed learners, ineffective communication in an online environment) [21, 22]. In addition, there are studies showing no significant differences in course effectiveness between traditional learning and blended learning [23, 24]. Therefore, more studies should be conducted to understand the potentials, designs, practices, and effects of blended learning in different higher education settings. In addition, few studies have examined blended learning development in Asian contexts. It is necessary to advance scholarly knowledge on blended learning and provide useful guidance for administrators and educators to design and implement effective blended learning courses in higher education in non-Western contexts, such as Hong Kong.

Higher education in Hong Kong has been undergoing significant changes. One significant change is the transformation of the previous three-year undergraduate curriculum to the new four-year curriculum to offer more general education to students [25]. Another change is the usage of information technology in teaching and learning to enrich students' learning experience. To facilitate these changes, the University Grants Committee (UGC) provides funding to support the course development and staff professional training on blended learning and e-learning in different universities [26]. With this support, a notable project on blended learning entitled "The Responsive University: Appreciating Content Sharing in General Education" ("Responsive 4U" in short) was initiated in the academic year of 2018/2019. Four top-ranking universities in Hong Kong participated in the project, including The University of Hong Kong, The Chinese University of Hong Kong, The Hong Kong Polytechnic University (PolyU), and The Hong Kong University of Science and Technology. This project attempted to develop "sharable" blended learning general education and "cross-institutional learning system" among different participating institutions. Specifically, eleven blended-learning general education courses were offered to students. Among the eleven courses under the "Responsive 4U" project, one blended learning course entitled "Service Leadership" is offered by PolyU. Design of "Service Leadership" blended course and preliminary evaluation findings for its course effectiveness are presented in sections below.

DESIGN OF "SERVICE LEADERSHIP" BLENDED COURSE

The "Service Leadership" course is a 3-credit general education subject designed based on the Service Leadership Model proposed by Po Chung, the Co-founder of DHL International (Asia Pacific). According to Chung [27], service leadership is defined as "satisfying needs by consistently providing quality personal service to everyone one comes

into contact with, including one's self, others, groups, communities, systems, and environments." Effective service leadership consists of three key components: "competence," "character," and "care" [28]. Nowadays, the global economy is transforming from manufacturing to service economy. For university students to remain competitive, it is important to develop their service leadership qualities to accommodate themselves to the new requirements. As an innovative response to this call, the "Service Leadership" course aims to help students understand basic models of leadership, be aware of leadership qualities of themselves, and apply the principles and improve themselves in daily life.

This course has been previously taught in a traditional classroom face-to-face approach at PolyU. The evaluation of the traditional course has been very positive since its inception in 2012/2013 academic year [29-31]. The blended version of this course was developed in the first semester of the academic year of 2018/19 and implemented under the "Responsive 4U" project in the second semester. A total of 43 students enrolled in the course, including both PolyU and non-PolyU students. We used Blackboard as the Learning Management System for this blended course.

The blended course lasted for 13 weeks, including 10 online sessions and 3 face-to-face lectures. The main structure of all 13 lectures is shown below:

- 1st Week (1st Lecture): "Introduction of Service Leadership Model" (face-to-face)
- 2nd Week (2nd Lecture): "Core beliefs and key components of service leadership"
- 3rd Week (3rd Lecture): "Basic leadership competencies: Intrapersonal competencies"
- 4th Week (4th Lecture): "Basic leadership competencies: Interpersonal competencies"
- 5th Week (5th Lecture): "Character strengths and service leadership"
- 6th Week (6th Lecture): "In-class interactions and consultation" (face-to-face)
- 7th Week (7th Lecture): "Care and service leadership"
- 8th Week (8th Lecture): "Character strengths in Chinese philosophies"
- 9th Week (9th Lecture): "Contemporary leadership models and the dark side of leadership"
- 10th Week (10th Lecture): "Factors leading to creation, development, and maintenance of positive social relationships"
- 11th Week (11th Lecture): "Self-leadership and service leadership"
- 12th Week (12th Lecture): "Developmental assets and service leadership"
- 13th Week (13th Lecture): "Review of effective service leadership qualities and wrap-up" (face-to-face)

ONLINE MODULES

As mentioned earlier, the course aimed to help students to understand basic models of leadership, be aware of their own leadership qualities, and apply the principals and improve themselves in daily life. Online sessions contained both video lectures introducing concepts and theories related to service leadership, as well as different activities improving students' understanding and leadership skills. These activities included reflective activities, tests, discussion forum, group discussion, and class chat sessions. Table 1 summarizes the features of this blended course and the duration/frequency of different activities.

Online Video Lectures

In each week, students were required to watch several videos online under the same topic. The videos lasted for around 3-18 minutes with an average duration of seven minutes. Through watching videos, students were expected to gain knowledge of basic leadership attributes and contemporary models of leadership in the service sector. Online video lectures were convenient for students to arrange a flexible study schedule, especially for non-PolyU and part-time students.

Table 1. Features of a blended course of service leadership

Blended design	Participants	Duration of activity	Learning tools
Online modules			
Online video lectures	Individual	Average 7 mins/ per video, 4-6 videos/per week, 10 weeks	Videos on Blackboard
Reflective activity	Individual	3-7 topics per week, 10 weeks	Reflective activities on Blackboard (e.g., reflective writing, arguments, write metaphor, etc.)
Online test	Individual	5-7 items per week, 10 weeks	Tests function on Blackboard
Online discussion forum	Among all students	5 times under specific topic in Week 2, 5, 8, 11, and 12	Blackboard discussion group
Group discussion	Among group members	3 times in Week 3, 7, and 9	No specific tool is regulated. Only discussion record is required. Students can use WhatsApp, group forum function on Blackboard, etc.
Online chat sessions	Among all students and lecturers	1 hour per session, 2 sessions in Week 3 and 10, respectively	Blackboard Collaborate Ultra
Face-to-face modules			
Face-to-face lectures	All students and lecturers	3 hours per lecture, 3 lectures in Week 1, 6 and 13	

Reflective Activities

We developed reflective activities to deepen students' understanding and reflection, and cultivate their service leadership qualities. Through reflective activities, students could reflect on the importance of developing essential service leadership attributes, leadership qualities of themselves, and the way to apply knowledge in daily leadership practice. Reflective activities targeted on higher educational objectives of learning goals according to Bloom's taxonomy, including applying, analyzing, evaluating, and creating [32]. For example, after watching a video explaining different types of contemporary leadership models, students were required to further reflect on the differences between these models and the Service Leadership Model. Compared to face-to-face classroom reflective activities, students felt less time pressure or insufficient preparation when completing online reflective activities, and tended to share more genuine in-depth thoughts. In addition, after obtained their approval, we uploaded students'

anonymous sharing on Blackboard so that all students could learn from their classmates' reflections. Besides, we specifically selected those topics demonstrating their creative thinking, problem-solving skills, integrity, and leadership. For those questions receiving interesting or controversial responses, we brought them to class chat or face-to-face lectures to further share or discuss with students.

Test

After watching online video lectures in each week, students were required to complete a final test to recall the knowledge covered in service leadership. The test was used to evaluate student's recalling and understanding of the basic knowledge [32]. Multiple choices, true and false, and cloze were often used in the final test. In addition, some open-ended questions were asked to collect feedback on the online lecture each week.

Group Discussion

Students were also required to conduct group discussion on a topic from time to time. Group discussion helped students to practice their leadership through group activities and facilitate their group project preparations. Students had full autonomy in the way to arrange their group discussions. Students could do it online or offline. No specific tool or approach was suggested. They could use WhatsApp or group discussion board on Blackboard. The discussion record was required for our reference.

Online Discussion Board

Some lectures contained discussion tasks, which required students to share their opinions on a given topic and to give comments to others' posts. Students needed to present their own ideas, review and respond to other perspectives. For example, we asked students to recommend books or movies reflecting key elements of service leadership. We adopted the discussion board on Blackboard.

Online Chat Sessions

Online class chat aimed to establish direct and instant communication between students and lecturers. Students could receive instant feedback from lecturers and vice versa. We attempted to tackle the issues raised during the online learning. For each chat session, we provided two timeslots for students to choose. Blackboard Collaborate Ultra was used.

FACE-TO-FACE LECTURES

Three face-to-face lectures provided introduction and periodical wrap-up to students. Feedback on online activities was also covered in these face-to-face lectures. We also provided many opportunities for students to practice and reflect service leadership qualities during the face-to-face lectures. Based on the results of the online activities, we gave further feedback and explanation. For example, we shared the data of students' online learning to motivate them, shared the distribution of their opinions on different topics, disclosed ourselves, and invited them to share their experiences and reflections. In addition, we also gave feedback to some questions they mentioned in the online feedback.

Table 2. Assessment scheme of the blended course “Service Leadership”

Time	Requirements	Marks
Each week	Participate in required online activities and complete assignments of each respective online lecture	10
In Lecture 6	Participate in classroom interactions	1
In Lecture 13	Participate in classroom interactions	1
Before Lecture 3	The Pre-Test Objective Outcome Evaluation Form	1
Before Lecture 13	The Personal Reflection Form	1
Class chat session time	Participate in two class chat sessions	1
Total marks		15

*1 mark for each online lecture 10 online lectures in total.

Course Assessment

The assessment of the blended course included three parts: class participation, group project, and term paper. For class participation, students were required to watch videos, participate in activities and complete related assignments on time to get the participation marks. For students who successfully completed all tasks on time, a total of 15 marks for Class Participation/Preparation were given. The assessment scheme is shown in Table 2. For the group project, each group needed to produce a 30-minute video presentation on one of the key elements of effective service leadership. Group project presentation showed students' understanding of theories and concepts related to service leadership qualities, interpersonal skills, personal and group reflections, and the recognition of essential elements of service leadership covered in the course. For the individual term paper, all students were required to submit term papers on topics related to Service Leadership. Individual term paper indicated students' understanding of key concepts and theories, their self-assessment and self-reflection based on personal experiences.

EVALUATION

To examine the effectiveness of the blended “Service Leadership” course in promoting student leadership qualities and well-being, we conducted a preliminary evaluation study. We employed multiple evaluation approaches, including the one-group pretest-posttest method,

subjective outcome evaluation, and qualitative evaluation. All students gave their written consent to participate in the study. The evaluation study aimed to answer the following three questions.

- Question 1: Do students show positive changes in service leadership qualities and well-being after completing the blended “Service Leadership” subject?
- Question 2: How do students perceive the subject?
- Question 3: How do students evaluate their learning experiences in this blended course?

OUR STUDY

The one-group pretest-posttest used service leadership qualities (“knowledge,” “attitude,” and “behavior”) and well-being (“positive youth development” or PYD, and “life satisfaction”) as major outcome measures. Students participating in the blended course were invited to respond to these measures through an online survey before the delivery of the first lecture (i.e., pretest) and after the completion of all lectures (i.e., posttest). The data collected from 28 students were matched between the pretest and the posttest. The demographic information of the matched sample is presented in Table 3.

The 40-item “Service Leadership Knowledge Scale” (SLK) was employed to measure knowledge. The 40 multiple-choice questions are related to knowledge of service leadership, such as “manufacturing versus service economies in the modern world,” “the importance of 3Cs to effective service leadership,” “everyone can be a leader,” “features of the service leadership theory,” and so on. Students get “1” point for the correct answer or “0” point for any incorrect answers. This knowledge scale was developed following a standardized procedure of constructing a reliable and valid assessment tool. Previous studies have supported its good reliability and validity [33].

Attitudes toward service leadership practice were measured by a 23-item version of the “Service Leadership Attitude Scale” (SLA) which used a 6-point rating scale (“1” = “strongly disagree,” “6” = “strongly agree”). This scale was also constructed based on a solid scale validation procedure and has been demonstrated to possess good psychometric properties [34, 35]. The 23 items were pertinent to different elements, such as “self-reflection” (sample item: “a leader should closely examine his/her own thoughts and behavior”), “caring disposition” (sample item: “a good leader listens to his/her subordinates’ views”), “ethical role model” (sample item: “A good leader uses himself/herself as an example to influence the behavior of followers.”), and so forth.

The 19-item version of the “Service Leadership Behavior Scale” (SLB) was adopted to assess student leadership practice on a 6-point rating (“1” = “strongly disagree,” “6” = “strongly agree”). The good reliability and validity of SLB have been supported by a series of validation studies [36, 37]. The 19-item scale includes different aspects of desired service leadership practice, such as “self-improvement” (sample item: “I keep learning new knowledge”), “problem-solving” (sample item: “I am able to argue in a logical way”), “resilience” (sample item: “When difficulties or setbacks appear in my life, I do not give up easily”), and so on.

Life satisfaction was measured through the Chinese version of “Satisfaction with Life Scale” (SWLS) [38, 39]. The SWLS included five items (e.g., “In most ways, my life is close to my ideal” and “The conditions of my life are excellent”) and adopted a 6-point rating scale (“1” = “strongly disagree,” “6” = “strongly agree”).

Table 3. Demographic information of participants

Demographic variables	Frequency	Valid Percent (%)
Gender		
Male	13	46.4
Female	15	53.6
Age		
18-year-old	2	7.1
19-year-old	4	14.3
20-year-old	8	28.6
21-year-old	8	28.6
22 or above	6	21.4
Mean = 21.11; SD = 3.02		

(n = 28 matched sample).

PYD attributes of students were assessed by “Chinese Positive Youth Development Scale” (CPYDS), using a 6-point rating scale (“1” = “strongly disagree,” “6” = “strongly agree”). The present study utilized 31 items (e.g., “I know how to communicate with others” and “I can differentiate between the good and the bad aspects of things”) in relation to 10 subscales. Three higher-order PYD qualities can be computed based on the specific subscales: 1) “Cognitive-behavioral competence” calculated by three subscales including “cognitive competence,” “behavioral competence,” and “self-determination”; 2) “Positive identity” calculated by two subscales including “clear and positive identity” and “belief in future”; and 3) General PYD qualities calculated by the remaining five subscales including “social competence,” “emotional competence,” “moral competence,” “spirituality,” and “resilience.”

Subjective Outcome Evaluation

Students were invited to complete a “Subjective Outcome Evaluation Scale” (SOES) after the last lecture in Week 13. A total of 19 completed questionnaires were collected and used for data analysis. The SOES allowed students to express their views toward the blended course in terms of perceptions of “course contents” (e.g., “the content design of the curriculum is very good”), “lecturer” (e.g., “the lecturers showed good professional attitudes”), and “course benefits” (e.g., “it has strengthened my self-confidence”). In addition, the SOES assessed students’ overall satisfaction with the blended course through the following three questions: a) “Will you suggest your friends to take this program?” b) “Will you participate in similar programs again in the future?” and c) “On the whole, are you satisfied with this program?”. All items included in the SOES used a 5-point rating and the scale showed good internal reliability in previous studies [29, 40, 41].

Qualitative Evaluation

During learning, students were encouraged to express their personal views toward each online lecture after they completed all learning activities required for each online lecture. Besides, during the two online chat sessions, students were also invited to share their learning experience and feelings. After the completion of the course, a personal reflection form was further used to collect subjective evaluation of their learning experiences in the blended course. First, students were asked to use three words to describe their feelings and perceptions. Second, students were invited to think of a metaphor with a brief explanation to stand for the subject. In total, 37 completed personal reflection forms were collected and student responses were reviewed and analyzed.

FINDINGS

As shown in Table 4, there was a trend of positive changes in all eight outcome indicators. However, due to the small sample size ($n = 28$), participants' pretest and posttest scores did not follow a normal distribution, which violated the precondition of conducting repeated-measures multivariate general linear modeling analysis. As a result, we performed a binominal test based on the aggregated data. The result suggested that the positive change of the eight indicators was significant ($p = .008$), which gave tentative support for the claim that the subject was effective to promote the development of the students.

Table 4. Student changes in outcome indicators based on aggregated data ($n = 28$)

Outcome Indicators	Pre-test	Post-test	Positive change	Binomial Test (p)
Higher-order PYD factors				
Cognitive-behavioral competence	4.59	4.75	Yes	.008
Positive identity	4.45	4.66	Yes	
General PYD qualities	4.39	4.55	Yes	
Total PYD score	4.48	4.66	Yes	
Life satisfaction	4.00	4.14	Yes	
Service leadership qualities				
Service leadership knowledge	27.68	31.93	Yes	
Service leadership attitude	4.82	4.90	Yes	
Service leadership behavior	4.67	4.81	yes	

Subjective Outcome Evaluation

Summaries of student responses in the SOES are presented in Table 5 and 6. Results showed that most of the students expressed positive evaluations on most evaluation items. For example, over 78% of the respondents agreed that “the objectives of the curriculum are very clear,” “the activities were carefully arranged,” and “on the whole, I like this course very much”. In addition, nearly 85% of the participants expressed that the course lectures had good teaching skills and they were willing to help students. Furthermore, more than 78% of the participants felt that their critical thinking and self-confidence were enhanced after taking the course. Overall speaking, 78.9% of the respondents were satisfied with the blended course.

Despite these positive evaluation findings, only around 45% of the participants thought that the course was helpful for the pursuit of meaning in life.

Table 5. Summary of the positive views (options 4-5) of the participants in different aspects

Items		N	M	SD	Positive Responses ^a	
					n	%
Perceptions of course content						
1.	The objectives of the curriculum are very clear.	19	3.89	1.12	15	78.9
2.	The content design of the curriculum is very good.	19	4.05	.83	15	78.9
3.	The activities were carefully arranged.	19	3.84	1.09	15	78.9
4.	The classroom atmosphere was very pleasant.	19	3.84	1.09	13	68.4
5.	There was much peer interaction amongst the students.	19	3.89	.91	14	73.7
6.	I participated in the class activities actively (including discussions, sharing, games, etc.).	19	4.11	.85	15	78.9
7.	I was encouraged to do my best.	19	3.79	1.10	14	73.7
8.	The learning experience enhanced my interests towards the course.	19	3.74	1.02	13	68.4
9.	Overall speaking, I have a very positive evaluation on the course	19	3.79	1.10	14	73.7
10.	On the whole, I like this course very much.	19	3.84	1.09	15	78.9
Perceptions of lecturer(s)						
1.	The lecturer(s) had a good mastery of the course.	19	3.95	.94	14	73.7
2.	The lecturer(s) was (were) well prepared for the lessons.	19	4.05	1.00	15	78.9
3.	The teaching skills of the lecturer(s) were good.	19	4.05	.94	16	84.2
4.	The lecturer(s) showed good professional attitudes.	19	4.05	.94	16	84.2
5.	The lecturer(s) was (were) very involved.	19	4.05	.83	15	78.9
6.	The lecturer(s) encouraged students to participate in the activities.	19	4.16	.99	16	84.2
7.	The lecturer(s) cared for the students.	19	4.16	.81	16	84.2
8.	The lecturer(s) was (were) ready to offer help to students when needed.	19	4.26	.64	17	89.5
9.	The lecturer(s) had much interaction with the students.	19	3.95	.89	13	68.4
10.	Overall speaking, I have a very positive evaluation on the lecturer(s).	19	4.05	1.05	16	84.2
Perceptions of course benefits						
1.	It has enhanced my social competence.	19	3.63	1.09	12	63.2
2.	It has improved my ability in expressing and handling my emotions.	19	3.74	1.02	13	68.4
3.	It has enhanced my critical thinking.	19	3.84	1.09	15	78.9
4.	It has increased my competence in making sensible and wise choices.	19	3.74	1.07	14	73.7
5.	It has helped me make ethical decisions.	19	3.74	1.07	13	68.4
6.	It has strengthened my resilience in adverse conditions.	19	3.79	1.06	13	68.4
7.	It has strengthened my self-confidence.	19	3.89	.91	15	78.9
8.	It has helped me face the future with a positive attitude.	19	3.79	1.06	13	68.4
9.	It has enhanced my love for life.	19	3.32	1.38	8	42.1
10.	It has helped me explore the meaning of life.	19	3.58	1.14	9	47.4
11.	It has enhanced my ability of self-leadership.	19	3.95	.89	13	68.4
12.	It has helped me cultivate compassion and care for others.	19	3.95	.76	13	68.4
13.	It has helped me enhance my character strengths comprehensively.	19	3.84	.93	13	68.4
14.	It has enabled me to understand the importance of situational task competencies, character strength and caring disposition in successful leadership.	19	3.95	.83	14	73.7
15.	It has promoted my sense of responsibility in serving the society.	19	3.74	.91	12	63.2
16.	It has promoted my overall development.	19	3.63	1.09	12	63.2
17.	The theories, research and concepts covered in the course have enabled me to understand the characteristics of successful service leaders.	19	4.05	.83	15	78.9
18.	The theories, research and concepts covered in the course have helped me synthesize the characteristics of successful service leaders.	19	3.79	.95	12	63.2

Note: ^a For every item, respondents with positive responses (Options 4-5) are shown in the Table.

Table 6. Summary of students’ overall satisfaction with the course

Items		N	M	SD	Positive Responses ^a	
					n	%
1.	Will you suggest your friends to take this course?	19	3.89	.85	13	68.4
2.	Will you participate in similar courses again in the future?	19	3.74	1.07	12	63.2
3.	On the whole, are you satisfied with this course?	19	3.95	.76	15	78.9

Note: ^aFor every item, respondents with positive responses (Options 4-5) are shown in the Table.

Qualitative Evaluation

For comments on each online lecture, students mainly opined that they learned useful knowledge and concepts about service leadership which could help them to understand effective leadership in service economies and related determinants. Besides, those online reflective activities can help them to think deeply about own strengths and weaknesses and how to improve. Most importantly, students commented that blended learning is convenient for them to arrange a study plan. In this regard, most students agreed that learning through online lectures could give them more flexibility. For example, they could do the lecture activities several times and perform revision by going through the whole lecture by themselves whenever they wanted to. However, some students also complained that the workload was heavier compared with other face-to-face general education subjects.

Regarding personal reflections, students positively evaluated their learning experience in the blended course. Specifically, students frequently used positive descriptors to present their feelings and subjective experience in the course. The frequently used descriptors included “interesting,” “inspiring,” “joyful,” “fruitful,” “enjoyable,” “useful,” “helpful,” “meaningful,” “interactive,” “reflective,” and “innovative.” Regarding metaphors, students’ positive expressions were impressive. For example, a student claimed that the course “seems like a travel trip where I can look around the world to learn somethings that I have never touched or seen before in every other destination (lecture).” Another student used “a mirror” because “it reflects a lot of my own leadership strategies and imperfections, just like a mirror reflects physical appearance”.

DISCUSSION

Previous evaluation findings have repeatedly indicated that the “Service Leadership” subject delivered through traditional face-to-face mode is successful in nurturing university students’ service leadership qualities and promoting their well-being [29, 41-43]. The present evaluation findings further suggest that a well-designed blended “Service Leadership” course is also a promising approach to promote service leadership qualities and well-being among university students. As one of the innovative and technology-enriched teaching pedagogies, blended learning is considered increasingly important or even the “new normal” in higher education [44, p. 207-208]. The re-design of the traditional “Service Leadership” course into a blended one complies with this global trend. Past research suggests that blended learning can entail great learning achievement among students as compared to either sole e-learning or

sole face-to-face learning [45-47]. This may be because the blended design is flexible and technology-oriented, thus can enhance student engagement [48, 49]. This speculation is consistent with the present observations that students appreciated the flexible study plan including the convenient revision plan they can enjoy in the blended course.

Of course, we have to be mindful of the limitations of the blended learning approach. First, studies suggest that blended learning raises more demanding requirements for institutional management, teaching staff's mindset, and students' skills in mastering multiple learning strategies [21, 22]. Second, blended learning requires students to take a more active role in learning and become intrinsically motivated, which is not in line with the characteristics of Chinese students who normally prefer didactic teaching [50, 51]. Third, as blended learning takes up much time of the students (e.g., going through the online activities and assignments), students taking up part-time jobs may not like it as it may interfere with their earning activities. This point is important when we realize that students at PolyU are mostly from the grassroots.

There are several limitations of the current evaluation work. First, the sample sizes were small. In addition, due to the absence of a control group, objective outcome evaluation was unable to inform the causal effect of the blended course. Furthermore, all data were collected through self-report measures. Hence, while the present evaluation findings tended to support the effectiveness of the blended "Service Leadership" course, the findings were very preliminary. There is a great need to collect more data from multiple informants in the future to further evaluate the course effectiveness of a blended "Service Leadership" subject.

During the implementation of the blended course, we encountered several challenges, which should be further tackled for course improvement. The first challenge is related to student engagement. For example, some students were not able to complete online learning on time and some others came to face-to-face lectures without good preparation. Manwaring et al. [52] argued that while blended designs have been perceived to effectively engage students in learning, blended classes can also make engagement more difficult for some students. Students with low self-regulation may not perform well in navigating online learning modules independently without others' monitoring [53]. Besides, some students may still prefer regular face-to-face learning contexts. These students may feel "isolated" due to reduced classroom interaction with classmates and teachers, which in turn leads to a lower level of learning motivation [44]. In fact, some students in our course indicated that they expected more face-to-face interactions, which may be due to the "passive" learning style they have developed during primary and high schools.

The second challenge has to do with teachers' timely feedback. Students were required to do some individual reflective activities after completing certain online learning. For example, students were asked to think about self-leadership strategies they used in daily life and ways to improve self-leadership. After most of the students provided their reflective responses, we reviewed these responses and gave feedback to each of the questions. Besides, to facilitate student learning, especially learning from others' experience, we summarized and shared student opinions among all students. However, as students had different time schedules in completing online lectures, it was not easy for teachers to collect all students' responses and gave timely feedback. Last but not least, some students perceived that the workload of online learning was heavier than traditional classroom classes. In this case, some students may fail to complete all learning activities, which consequently hinder the achievement of intended learning outcomes.

To help students engage in online learning and better interact with peers and teachers, one feasible strategy is to design tailor-made group activities. For example, asking students to do a group discussion focusing on a specific topic where related concepts have been covered by online lectures. This will motivate students to learn and understand online learning materials and further digest knowledge through peer interactions (i.e., collaborative learning). Besides, it is also possible to have pre-lecture group activities, which may get students well-prepared for face-to-face lectures. Furthermore, group activities incorporating reflective learning may reduce students' workload. In short, we need to optimize online and offline activities to better engage students and facilitate their learning.

Despite the limitations of the preliminary positive evaluation findings and several challenges in implementing the blended "Service Leadership" course, the present study represents a pioneering effort in putting blended service leadership education into practice and examining its educational effects through multiple strategies. In conclusion, the blended mode can be regarded as an effective pedagogy to involve more students with diverse backgrounds and to provide them with flexibility in learning.

ACKNOWLEDGMENTS

The development of the Service Leadership subjects and preparation for this paper are financially supported by the Victor and William Fung Foundation and the Service Leadership Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University as well as the UGC Teaching Development Grant Project entitled "The Responsive Universities: Appreciating Content Sharing in General Education". This chapter is based with permission on a paper adapted from a special issue published in the *International Journal of Child and Adolescent Health* 2020;13(2) issue.

ABSTRACT

How can we develop and nurture leadership in service economies? This issue is of upmost importance, because the mode of production and requirements of the leaders are

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

different in manufacturing and service economies. While the focus in manufacturing industries is on “do things right,” the focus of services economies is on “do the right things.” In this book we start out with the Service Leadership Model as well as the ingredients on Service Leadership knowledge, attitude, and behaviors (i.e., skills). Second, psychometric properties of three validated measures on Service Leadership knowledge, attitude and behavior are presented. In these chapters, the internal consistency, convergent validity and factorial validity of the measures are presented. Third, the psychosocial correlates and norms associated with these three measures of Service Leadership are presented. Through these chapters, we attempt to establish the psychometric properties and norms of the scales assessing Service Leadership knowledge, attitude and behavior. Finally, user manuals for the three assessment tools are also presented. It is our humble wish that the related work and the developed assessment tools can be used in the training, personnel decisions, intervention and research contexts.

INTRODUCTION

With the growth of service industries in the global world, there is a need to ask how we can nurture leadership in service economies. This is important because the mode of production and requirements of the leaders are different in manufacturing and service economies [1]. While the focus in manufacturing industries is on “do things right,” the focus of services economies is on “do the right things.” Besides, leadership style in service economies is often “bottom-up,” which is different from the “top-down” style in manufacturing industries. In view of the unique features of service economies, we need a leadership model which can meet the needs of service economies [2].

To address the issue of service leadership in the changing economies, Dr. Po Chung (Co-founder of DHL International and Chairman Emeritus of DHL Express (Hong Kong) Ltd. and Chairman of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM)) proposed the Service Leadership Model. According to HKI-SLAM [3], service leadership “is about satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments. A service leader is a ready, willing and able, on-the-spot socialized entrepreneur who possesses relevant task competencies and is judged by superiors, peers, subordinates, and followers to exhibit appropriate character strengths and a caring social disposition.” The Service Leadership Model is based on Chung’s seminal works on service reborn [4], 25 principles essential for service leadership [5] and 12 dimensions of one’s personal brand [6].

To promote Service Leadership education in the publicly-funded universities in Hong Kong, Li and Fung Foundation provided HK\$40 million to support a project on Service Leadership Education in Hong Kong. In the eight universities funded by the University Grants Committee, researchers developed credit-bearing subjects, non-credit-bearing programs and curriculum materials. In some programs, some evaluation work was done using some tentative measures of service leadership qualities [7, 8].

Unfortunately, Service Leadership education has been hindered due to its lack of validated measures of Service Leadership knowledge, attitude and behavior. Similarly, the lack of related validated measures also hinders the development of Service Leadership research. The development of measures based on the Service Leadership Model is important

for several reasons. First, as Service Leadership Model is still at its infancy and there is limited research underlying the concepts and theories of Service Leadership, validated measurement tools are vital to the future development of the model. Slavec and Drnovšek [9] argued that “effective measurement is a cornerstone of scientific research ... reliable and valid measures contribute to the legitimacy and development of a research field” (p. 39). Second, the scales would allow for investigations on the determinants and outcomes of effective Service Leadership qualities, and how these qualities are related to organizational effectiveness [2]. Third, assessment tools in Service Leadership are important because they can be used to examine the effectiveness of related intervention programs. For example, it would be extremely important to understand whether Service Leadership training programs really promote Service Leadership qualities in the program participants.

THREE AREAS OF IMPORTANCE

There are three areas that should be assessed as far as Service Leadership qualities are concerned. The first area is Service Leadership knowledge. Assuming that we are asked to create a credit-bearing subject on Service Leadership, we have to ask what fundamental knowledge on Service Leadership will be included. Basically, Service Leadership knowledge includes core beliefs of the Service Leadership Model (such as everybody can be a leader) and components of effective Service Leadership (competence, moral character and caring disposition). For example, as far as moral character is concerned, a service leader should appreciate the importance of morality and integrity and what constitutes an ethical leader (“know-what”). Besides, one must know the determinants of moral judgments such as motivation to act in a moral manner, moral reasoning, and reflection on one’s Personal Operating System. Regarding caring disposition, one should know its components, such as empathy, love, and sensitivity to others’ needs and emotions.

For attitude to Service Leadership, it basically addresses one’s beliefs and feelings about Service Leadership, such as whether one agrees to the core beliefs of Service Leadership and the basic ingredients of effective service leadership. Most important of all, it is important to assess whether one has a service mindset, such as care about oneself as well as others, and to be sensitive to others’ needs. Besides, whether one identifies with the importance of moral character, such as the degree of agreement with the importance of character strengths based on the Western literature and Confucian values based on Chinese philosophies.

For Service Leadership skills, an effective service leader should possess intrapersonal skills (such as resilience, emotional competence, social competence, courage and vision) as well as interpersonal skills (such as relationship building, team building and conflict resolution skills). Besides, service leaders should learn “maritime” leadership style combining both top-down and bottom-up leadership models and appreciate distributive leadership styles. As caring leaders, effective service leaders should also know the skills of developing others and mentorship abilities.

ABOUT THIS BOOK

Against the above background, there are several parts in this book. First, the Service Leadership Model as well as the ingredients on Service Leadership knowledge, attitude and behaviors (i.e., skills) are presented. Second, psychometric properties of three validated measures on Service Leadership knowledge, attitude, and behavior are presented. In these chapters, the internal consistency, convergent validity and factorial validity of the measures are presented. Third, the psychosocial correlates and norms associated with these three measures of Service Leadership are presented in three papers. Through these chapters, we attempt to establish the psychometric properties and norms of the scales assessing Service Leadership knowledge, attitude and behavior. Finally, user manuals for the three measures on Service Leadership knowledge, attitude, and behavior are also presented. It is our humble wish that the related work and the developed assessment tools can be used in the training, personnel decisions, intervention and research contexts.

ACKNOWLEDGMENTS

This chapter is an updated version of a publication in the special issue “Development and validation of assessment tools on service leadership knowledge, attitude and behavior” edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

Leadership research in different Chinese contexts is growing rapidly with plentiful assessment tools emerging in the field. Using a cross-cultural study framework, this chapter provides an overview of contemporary leadership assessment tools used in different Chinese contexts. The leadership assessment tools developed by the etic approach, emic approach and combined etic-emic approach all contribute to the knowledge advancement of leadership, yet their limitations should also be noted. This chapter ends with a critique of Chinese leadership assessment tools and recommendations for future directions.

INTRODUCTION

Contemporary leadership theories commonly define leadership as a dynamic and reciprocal process in which one influences a group of people to achieve a collective goal [1, 2]. Leadership has been regarded as universal human behavior that has an evolutionary function for solving adaptive problems [3, 4]. However, the views toward the relationship between leadership and culture are not uniform. On the one hand, some scholars believe that there are some fundamental components of leadership shared by different cultures [5]. Additionally, the growing globalization over the world makes the leadership conceptualization and practices in Western and Eastern organizations become increasingly aligned over time [6]. On the other hand, some scholars believe that how people understand and practice leadership may vary across cultures [7, 8]. Cultural values may define what an ideal leader is in a specific culture, which influences how people practice their leadership in the organization and develop their leadership. Depending on their theoretical perspectives, researchers used different assessment tools to measure leadership in a particular culture.

There are three approaches to the inquiry of leadership in the Chinese contexts: the etic approach, the emic approach, and the combination of etic and emic approach [7]. First, researchers translated and validated the existing scales developed in Western cultures in order to test the generalizability of the existing leadership theories and models to Chinese contexts (i.e., etic approach). Second, researchers developed an indigenous leadership scale based on the Chinese leadership construct in order to capture psychological constructs that are not present in Western cultures (i.e., emic approach). Finally, researchers developed and validated a new scale based on both Western and Chinese concepts (i.e., etic-emic approach).

In this chapter, we reviewed the commonly used leadership assessment tools in Chinese contexts with reference to the related studies conducted in mainland China, Hong Kong and Taiwan. In the organizational realm, assessment tools of leadership usually measure leadership qualities including attitudes, beliefs, behavior and styles of people who take up a leadership post, using measures such as the Multifactor Leadership Questionnaire MLQ; [9], Authentic Leadership Inventory [10], and Paternalistic Leadership Scale [11]. In addition, in the realm of leadership development and education, based on the assumption that everyone has potentials and capacities to develop leadership [12], several scales have been developed to capture the leadership capacities of ordinary people regardless of their positions, such as Socially Responsible Leadership Scale SRLS; [12] and Leadership Practices Inventory [13]. This review covers leadership assessment tools for “positional” leaders and “ordinary” leaders. In particular, based on the scales reviewed, we identified the gaps and problems of the existing literature on leadership assessment tools in different Chinese contexts.

ASSESSMENT TOOLS BASED ON THE ETIC APPROACH

One of the major inquiries in Chinese leadership study is to test whether the imported assessment instruments measure the same construct across cultures. Therefore, validating the existing leadership measures developed in Western contexts is an initial step of leadership study in the Chinese academia. With validation evidence, researchers could test whether the Western leadership theories and models are applicable to Chinese contexts, and further extend

the theories by examining the mechanisms underlying the effects of a certain leadership practice or investigating the conditional boundary of these effects. This approach is called etic approach.

The characteristics of etic approach are top-down and Western in origin [14]. Guided by a Western leadership theory or model, researchers usually translate the assessment tools with literal adaption following a translation-back translation procedure [15]. For example, Chen and Farh [16] translated the Transformational Leadership Scale developed by Podsakoff, MacKenzie, Moorman, and Fetter [17], and found it well applied in Taiwan organizations. This scale assesses six features of transformational leadership practices, including identifying and articulating a vision, providing a role model, fostering the acceptance of collective goals, expecting high performance, offering individualized support and intellectual stimulation [17]. This translated version has been successfully used in many Chinese studies. For instance, Wang, Law, Hackett, Wang, and Chen [18] successfully validated the six-dimension structure via confirmatory factor analysis (CFA), and used it to examine the mediator that explained the associations between transformation leadership and positive performance and organizational citizenship behavior of followers in mainland Chinese organizations. Another example is Chan and Mak's [19] study that translated the 28-item Servant Leadership Scale developed by Liden, Wayne, Zhao, and Henderson [20] to examine the moderating effect of subordinates' organizational tenure in the association between servant leadership and subordinates' trust in leader and job satisfaction in Hong Kong organizations. This scale has seven factors – emotional healing, creating value for the community, conceptual skills, empowering, helping subordinates grow and succeed, putting subordinates first, and behaving ethically with good factorial validity. Additionally, Sun and Wang [21] translated the 23-item servant leadership scale developed by Barbuto and Wheeler [22] and examined the construct of servant leadership in mainland Chinese organizations. The original scale included five dimensions – wisdom, persuasive mapping, organizational stewardship, altruistic calling, emotional healing. This translated version demonstrated satisfactory reliability and similar internal structure (i.e., 5-factor structure) via exploratory factor analysis (EFA) and CFA, but there were slight differences in the number of items in each factor because some items were removed due to under loading.

In addition to leadership research in organizational settings, Chinese scholars also investigated leadership capacities of ordinary people, especially young people regardless of their leadership background. Therefore, similar to the case of leadership measures for positional leaders, Chinese translated versions of existing scales that assess leadership capacities are available in the literature. For example, based on the social change model, Dugan and Komives [12] developed the Socially Responsible Leadership Scale (SRLS) and its shortened version (SRLS-R2). These scales assess eight core values, including consciousness of self, congruence, commitment, courage, collaboration, common purpose, controversy with civility, and citizenship. Leung, Ha, and Yeung [23] translated the SRLS-R2 and tested it in Hong Kong university students. Results showed adequate evidence for the eight-factor structure, and the reliability for each subscale (factor) was satisfactory except for the change and controversy with civility dimensions. Additionally, Chan [24] created a Chinese version of 26-item self-reported Roets Rating Scale for Leadership (RRSL) [25] to measure three leadership capacities (i.e., leadership, ambition and desires) of Hong Kong students in grades 7-12, which showed satisfactory reliability and convergent validity with other leadership measures based on behavioral indicators reported by parents and teachers.

Because of the rapid development in psychology and organizational behavior in China, Chinese translated version of Western leadership scales are common. Besides the scales mentioned above, there are many other examples in the literature, such as the Chinese version of Authentic Leadership Questionnaire [26] translated by Qian, Lin, and Chen [27], the Chinese version of Leadership-Member Exchange Scale (LMX-MDM); [28] translated by Wang et al. [18], and the Chinese version of Ethical Leadership Scale [29] translated by Walumbwa et al. [30].

The application of Western assessment tools has made an important contribution to leadership knowledge development. Theoretically, it helps to advance the scientific understanding of general leadership process. The use of same assessment tool makes it possible to compare the findings derived from different cultures so as to identify cultural similarities and differences in the leadership process. Practically, it enables Chinese scholars to quickly catch up with the current trend of leadership research. It also facilitates the communication between Chinese scholars and Western scholars as they would have shared language. However, there are some intrinsic limitations of the etic approach [14], which constrain the development of leadership research in Chinese contexts. Primarily, these scales overlook the cultural component in leadership process (i.e., substantive limitation). For example, some cultural practices of leadership relevant to the Chinese context are not present in Western experience, and thus would not be included in the Western assessment tools. For example, the Leader-Member exchange (LMX) theory that focuses on the exchange within work domain was developed in the Western context. However, Chinese type of leader-member interaction goes beyond work issues and permeates into personal domains [31]. Hence, simple reliance on Western assessment tools leaves a large gap in understanding Chinese leadership and hinders researchers from a deep inquiry into the cultural variation in the field of leadership. It also constrains the initiative of Chinese scholars to construct leadership theories and models.

ASSESSMENT TOOLS BASED ON THE EMIC APPROACH

In response to the limitations of the etic approach that transplants Western leadership measures, some Chinese scholars proposed to focus on indigenous Chinese leadership [32, 33]. In contrast with the top-down orientation adopted in the etic approach, the emic approach tends to be bottom-up and to study leadership process from laypersons' perspectives. They usually construct leadership theories and leadership assessment tools according to local phenomena and experiences, and interpret the data using Chinese concepts, such as Confucian ideas.

Paternalistic leadership is an indigenous leadership style that has been well-studied in Chinese culture, which was proposed by Farh and Cheng [32] based on the Chinese history and the traditional ideologies (i.e., Confucianism and legalism). It refers to a leadership style with strong discipline and authority accompanied with fatherly benevolence and moral integrity [32]. Accordingly, Cheng, Chou and Farh [11] developed the 42-item Paternalistic Leadership Scale (PLS), which includes three unique components of Chinese leadership style – authoritarianism (i.e., “very strict with his/her subordinates”), benevolence (e.g., “encourages me when I encounter difficulties in work”), and morality (e.g., “sets an example

for me”). The PLS demonstrated satisfactory reliability and consistently showed a three-factor structure across Chinese societies, including Taiwan [34], mainland China [35], and Hong Kong [36]. It has become the most widely used scale that measures indigenous leadership style and demonstrated validity in predicting a wide range of leadership effectiveness indicators, such as employee’s trust in and satisfaction toward leaders [11], employees’ performance [34], and employees’ voice behaviors [37]. In particular, Cheng, Chou, Wu, Huang, and Farh [38] found that paternalistic leadership demonstrated a unique effect on employees’ responses above and beyond the effect of transformational leadership, which confirmed its cultural uniqueness in influencing leadership effectiveness. Furthermore, with revision on the items of morality, Cheng et al. [39] developed the Global Paternalistic Leadership Scale (GPLS), and successfully validated it across four Asian societies, including Taiwan, mainland China, Japan and South Korea.

In addition, several other scholars also attempted to construct a cultural-specific leadership style that can well describe the leadership features and predict leadership effectiveness in Chinese culture [40]. For example, Wang, Xin, and Xu [41] asked the participants of senior managers to articulate the leadership behavior of their CEO, upon which they developed a CEO leadership scale to understand the CEO leadership behavior during the economic transformation of China. This scale includes six dimensions of leadership behavior, including making innovation, coordination and communication, caring about subordinates, identifying visions, demonstrating authority, and monitoring operations. These dimensions were positively related to enterprise profit and employees’ attitudes [41].

The use of indigenous leadership assessment tools helps to explore and understand some culturally specific experiences in the leadership process. Indigenous leadership research makes a significant contribution to a growing body of literature documenting human behavior from a local perspective. Although many researchers are interested in developing a scale to capture Chinese specific leadership, not all of them provided adequate validation evidence. A rigorous emic approach requires evidence for the incremental validity of the indigenous scale. In other words, the indigenous construct should explain more of the leadership effectiveness than other existing scales, but this is often missing in the scale development. Furthermore, the indigenous leadership construct may not be totally specific to a certain culture. Instead, it may be a culturally specific manifestation of a general leadership concept. For example, paternalistic leadership does not only exist in Chinese culture. Indeed, it reflects a hierarchical leader-follower relationship, in which leaders are obliged to create a family-like environment and provide protection and guidance to their followers in both the work and non-work domain, and the followers are expected to show obedience and loyalty toward the leaders, which can be observed in multiple cultures [42]. However, people’s prototypical understanding of paternalistic leadership varies across culture. For example, Chinese people perceived typical paternalistic leadership incorporating more authoritarianism than Western people [43]. Therefore, simple reliance on indigenous leadership assessment tools may fail to capture the common component in leadership shared by different cultures. It also hinders the communication between Chinese researchers and Western researchers due to a lack of shared framework. In order to advance the field of leadership, we need to address both culturally universal and specific aspects of the leadership process.

ASSESSMENT TOOLS BASED ON THE ETIC-EMIC APPROACH

In different Chinese societies, an emerging effort has been made to study leadership by using a combined etic-emic approach. Researchers usually develop a leadership assessment tool based on Western literature theories, cultural theories, indigenous concepts and local leadership experiences [44]. This approach is able to link the indigenous leadership understanding with the so-called mainstream leadership understanding derived from Western research, and provide a more comprehensive framework to understand both the culturally universal and specific components in the leadership process.

The operationalization of transformational leadership in Chinese context can exemplify this approach. Transformational leadership refers to a leadership style, in which leaders strive to inspire followers to work toward common goals through setting up a role model for followers, showing individualized consideration toward followers, stimulating cognitive transformation of the followers, and inspiring their motivation to achieve higher [45]. However, Chinese researchers [44] argued that Chinese leaders may demonstrate different practices in order to reach the transformational goal due to the larger power distance between leaders and followers and stronger concern for interpersonal relationship. Thus, they asked Chinese managers to provide leadership behavior examples, upon which they worked out a new scale to measure Chinese transformational leadership. This scale contains four dimensions – moral modeling, charisma, visionary, and individualized consideration. The inclusion of moral modeling, which is missing in Bass's MLQ, shows the importance of moral modeling in Chinese people's understanding of good leadership. Additionally, in the dimension of individualized consideration, behavior of caring about the family and personal lives are included, which suggests the range of leader-follower interaction is expected to be broader than that in Western contexts.

A similar case was found in the construct of authentic leadership. There are at least two scales developed in the Chinese contexts to measure this leadership style [46, 47]. Taking Wang and Chen's [46] scale as an example, they developed this scale based on the previous scales developed in the Western contexts [e.g., 48] and their qualitative studies in Chinese organizations which examined employees and leaders' views toward authentic leadership. With this scale, they found the common components of authentic leadership shared by Chinese and Western cultures, including self-consciousness and internalized moral values, and an additional Chinese component of value-behavior congruency.

The use of combined etic-emic approach to developing leadership assessment tool has several merits. First, it is grounded in a larger body of literature and more integrated view about leadership, which likely provides a more comprehensive understanding on a certain leadership construct. Second, it helps to explicate both universal and cultural aspects of leadership process. It may provide generalizability evidence for a certain leadership theory and culturally unique findings that complement the theory. Finally, with a common conceptual framework, Western and Chinese researchers can better communicate their research findings and jointly endeavor to advance the field. However, the development of this combined approach in the leadership research in Chinese contexts is still in its infancy. Much more studies are needed to show the validation evidence, especially incremental validity of these scales.

UNSOLVED QUESTIONS AND FUTURE DIRECTIONS

The history of leadership assessment tools in Chinese contexts resembles that of many psychological assessment tools such as personality assessment [14]. It starts with an etic approach, an emic approach, and then a combined etic-emic approach. However, the etic approach still dominated the field of leadership, probably because of its ease of implementation. Obviously, this would hinder the contribution of Chinese experience to the leadership research and the initiative of Chinese scholars in the leadership theory construction. Emerging research has informed us that leadership is an integration of universal human nature and cultural influence [5]. For example, based on a study of 62 countries and areas, the Global Leadership and Organizational Behavior Effectiveness (GLOBE) Project found that some leadership qualities are universally desirable (e.g., charismatic and value-based leadership), while others are more culturally sensitive (e.g., participative leadership; [49]). Hence, to cover both universal and cultural elements of leadership, using a combined etic-emic approach to develop leadership assessment tools is an ideal direction. By doing this, researchers need to incorporate cultural variations by using samples from multiple cultural origins when developing and validating a scale [6]. The current validation of Chinese original leadership scales is often limited in one single culture, and thus requires more replications.

Additionally, there is an obvious lack of leadership assessment tools for ordinary people in Chinese contexts. The majority of the leadership scales were developed in an organizational context to assess leadership qualities or practices of formal leaders or positional authorities. However, in the field of leadership development and education, more and more researchers and educators believe that everyone has the potentials and capacities that enable him/her to carry out effective leadership no matter whether he/she takes up a leadership position [12, 50]. Increasing research has been conducted to understand how ordinary people develop their leadership capacities and how leadership program helps to enhance their leadership capacities [12, 51]. The dearth of leadership assessment tools for ordinary people in Chinese contexts hinders the advance of research on leadership development and education as well as the improvement of leadership programs. Moreover, leadership development and education would benefit if a norm of leadership capacities can be built, so that people can know how well their leadership capacities are by referring to the norm. It is thus necessary to develop a scale that measures leadership capacities for a wide range of population in Chinese contexts.

Indeed, a leadership scale is an instrument to operationalize a leadership concept, and thus whether the initial conceptualization is clear matters. Nowadays, there are plentiful leadership theories that try to capture an effective leadership style in contemporary organizational or social settings, including, but not limited to, transformational leadership [52], authentic leadership [53], servant leadership [22], and service leadership [50]. For the leadership development, theories and models are also growing, including relational leadership model [54], social change model [12], and leadership identity development model [55]. It remains a big challenge for Chinese researchers to synergize different perspectives and generate a suitable theoretical model of leadership that can well explain leadership experience in Chinese contexts but also contribute to the understanding of basic leadership process. Before developing a new assessment, Chinese researchers may need to adopt an integrated or cross-cultural view to conceptualize leadership. As suggested by Komives and Dugan [1],

contemporary leadership theories share three essential themes, including importance of leaders' self-awareness, morality and social responsibility in leadership, and shared leadership. Chinese leadership theory may need to integrate these three themes in the conceptualization of leadership, and develop the scales accordingly. In brief, we encourage future research to adopt an etic-emic approach in studying leadership and measuring leadership in Chinese contexts. We also call for developing reliable and valid assessment tools to measure leadership capacities of ordinary people. Addressing these unsolved questions requires a joint effort of Chinese scholars and collaboration of Western and Chinese scholars.

There are several recommendations regarding development of leadership scales in the Chinese contexts in future. First, a well-articulated conceptual model of leadership should be used. It could be a Western theory with or without adaptation, an indigenous theory derived from Chinese experience and/or theory, and integrated leadership model integrating Chinese and Western models of leadership. Second, validation is another task to be taken which includes several steps: a) development of an item pool; b) refinement of the pool by experts; c) empirical validation to ascertain the reliability and validity of the developed measures. For reliability, besides internal consistency (i.e., homogeneity of the items), there is a need to look at whether the scale is stable across time. For validity, besides examining content validity and criterion-related validities (such as concurrent validity and predictive validity), dimensionality of the measures based on the guiding conceptual model should also be tested to give support for the theory behind the measures.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

Knowledge plays a key role in shaping behavior in human beings. Leadership knowledge has been extensively studied for its contribution to productivity at both individual and organizational levels. With the service industries rooted as the key to the success of Hong Kong's economy, an appropriate service leadership knowledge framework should be developed based on the demand for leaders in the modern service economies. This chapter introduces the conceptual background of the Service Leadership Theory, and how Service Leadership Knowledge Scale was developed and validated based on the basic knowledge points under the Service Leadership Theory.

INTRODUCTION

Knowledge refers to one's awareness of an objective, related processes, and how to do something [1]. It is widely believed that people's previous experience and knowledge shape not only people's judgement and attitudes but also the actual behaviors [2]. For example, people's level of environmental knowledge including environmental responsibility [3] and ecological awareness [4] was found to be associated with their ecological consumer behaviors, such as consumption, reuse and willingness to pay more for ecological products. In a systematic review [5], the importance of cardiac patients' knowledge was highlighted where patients' level of knowledge about cardiac care facilitates the health behavior change such as participating in physical activities, healthier dietary habits and smoking cessation. Moreover, increasing financial knowledge was a means of increasing people's responsible credit card use behavior [6].

Given the influence of knowledge on human behaviors in many fields, numerous theorists have explored the way in which knowledge influences behavior. For example, the mediated role of attitude has been emphasized. The Knowledge-Attitude-Behavior model proposes that accumulation of knowledge can motivate changes in attitude, thus further lead to behavioral changes [7]. The theory of planned behavior suggests that subjectively held information determines certain behavior [8]. Besides, the process of putting knowledge into action is considered worthy of attention. In the information-motivation-behavioral skills model, knowledge and motivation jointly influence behavior to the equivalent extent through the mediation of developing behavioral skills [9]. Knowledge-to-action cycle suggests knowledge phase can influence action phase at any point, and the process of translating knowledge to behavior is an iterative cycle in which knowledge and behavior update themselves anytime through dynamic interactions [10].

INFLUENCE OF LEADERSHIP KNOWLEDGE ON LEADERSHIP BEHAVIOR

As an important form of human behavior, leadership behavior is affected by leadership knowledge as well. Leadership knowledge includes three dimensions. First, leaders have to be equipped with hard leadership knowledge, which can be defined as a series of basic knowledge concerning managing different kinds of resources in organizations, including human resources [11], information resources [12], and financial resources [13]. Second, leaders are expected to have soft leadership knowledge, which can be defined as the knowledge used to establish emotional connections in a team. This form of knowledge includes how to build relationships with others, how to construct effective collaboration and how to improve management environment [14]. Third, an excellent leader needs to accumulate adequate or a very high level of leadership content knowledge, which was purposed and conceptualized by Stein and Nelson [15] as the technical or academic related knowledge in the industrial field. In other words, leaders are expected to be equipped with knowledge and technical skills closely related with industries before constructing and strengthening leadership among subordinates.

Leadership knowledge serves as a unique window to look inside the science of organizational behavior and has been found to exert influence on leadership behavior at the individual and organizational levels. At the individual level, Weitz and colleagues [16] emphasized the role of leadership content knowledge and suggested that content knowledge of service providers in understanding their customers may change the directions of their behavior towards a more effective way. Similarly, Yammarino and colleagues [17] demonstrated that basic management knowledge, soft leadership knowledge like perspective-taking, creative problem solving, and social judgment skills and leadership content knowledge related with industries all positively directed management behaviors, including assessing a solution, identifying limitations, making action plans, and organizing supporting resources as input to management activities. At the behavioral outcome level, by surveying 102 teams in hotel properties in the United States, Srivastava and colleagues [18] showed that leadership content knowledge and self-efficacy positively predicted service performance.

Several theoretical proposals can be utilized to explain how leadership knowledge as a complex management input can be connected to positive management behavior and outputs at the individual level. For instance, leadership knowledge as a general cognitive capability may have positive effect on leadership behavior through the mediation of improving positive management attitude, increasing self-efficacy and strengthening administrative behavioral control, the theoretical foundation of which is supported by the model of planned behavior [19]. The extended model of the planned behavior adds another two likely pathways connecting leadership knowledge to leadership behavior through self-identity and affective self-beliefs [20]. Similarly, based on the theory of reasoned action, leadership knowledge can impact on leadership behavior through shaping the positive attitude and positive subjective norms [21]. The similar technology model also supports the role of leadership knowledge in directing positive management behaviors [22]. In this model, leadership content knowledge as an external force motivates leaders to evaluate the usefulness and feasibility of purposed management plans, which further promotes positive leadership behavior through the effect on positive behavioral intentions [22].

At the organizational level, hard leadership knowledge improves the capacity of transforming resource into productivity; soft leadership knowledge spurs the potential of team and increases the motivation of its members, while leadership content knowledge helps leaders to expose organizations to external opportunities for development [23]. These mechanisms suggest a positive association between leadership knowledge and favorable organizational behavior and outcome. In line with this notion, soft leadership knowledge was proven critical to the success of organizations in terms of the performance of workers based on qualitative analysis in the study of Pearce and Manz [24]. In addition, with a sample of 144 U.S. employees in a network of university libraries, it was found that leadership content knowledge positively predicted organizational citizenship behaviors [25]. With a sample of 710 nurses in the South Korea, Lin and Hsiao [26] found leadership content knowledge and trust to subordinates were positively related to the organizational citizenship behaviors. Similarly, with a sample of industrial companies from four innovative industries in Spain, hard leadership knowledge and leadership content knowledge were found to promote organizational behavior and innovation through the effect of positive management practice [27].

As shown, a majority of pervious empirical studies connecting different types of leadership knowledge and leadership behavior (and behavioral outcomes) actively examined

the role of leadership content knowledge, and only a very small part of them aimed to investigate the importance of soft leadership knowledge. With the global transformation in economic structure from the manufacture economy to the service economy, the framework of leadership knowledge needs to be redefined. It needs to be transformed from a framework focusing on hard leadership knowledge and leadership content knowledge, which best responded to the production and cooperative mode in the manufacture economy, to the one emphasizing on soft leadership knowledge, which can maximize the effectiveness and quality of service in the service economy. When specifying the leadership in modern service economy, Chung and Elfassy [28] proposed the Service Leadership Theory, which displays 12 dimensions of positive attributes an effective service leader should be equipped with. Under the framework of the Service Leadership Theory, the basic knowledge points are summarized and presented in section below.

SERVICE LEADERSHIP KNOWLEDGE

Based on Service Leadership Theory, service leadership knowledge can be summarized in six domains. These domains are “general description of Service Leadership Theory,” “three realms of service leadership,” “everyone can be a leader,” “Principle $E = MC^2$,” “manufacturing versus service economies in contemporary world,” and “distinction of Service Leadership Theory and other leadership theories.” Knowledge points in these six domains are briefly outlined below.

General Description of Service Leadership Theory

Unlike the old paradigm of leadership where the relationship is hierarchical and the leader only places orders to those who are in lower positions for self-serving purpose, Service Leadership Theory emphasizes the importance of satisfying not only the needs of oneself but also others and the systems such as community, society, and environments [29]. The traditional concept of “leader” is signified with power and pride, and the leader is likely to be served by others instead of the opposite. To an extreme extent, the leaders might use their power to scarify others’ needs and benefits to fulfill their own needs. Such action is considered as unethical. In order to be an ethical service leader, one should work with others with care, value their wellness and benefits as much as oneself, and encourage to transcend self-interest to serve others and the system. According to Shek and colleagues [30], good service leaders are those who influence their subordinates with good personal qualities such as being caring and genuine, rather than manipulating others.

Three Realms of Service Leadership

Noteworthy, service leadership emphasizes not only personal interest and achievement, but also the intention to fulfill the needs of others and the systems. The three realms including self, other, and the system of service leadership indicate the importance for a person to

manage himself or herself before leading others. Chung [31] suggested that before a person becoming a competent service leader, one should focus on improving his or her intrapersonal competence. It is believed that “a leader is unable to optimize his or her ability to lead others well unless he or she is healthy in mind, body, and spirit.” In other words, one’s ability to lead oneself is one of the best indicators of his or her capacity to lead others [32]. Such concept shares similar value to a Confucianism thought in Daxue, which points out that if people are able to regulate the standpoint of showing love for others, interpersonal harmony and social stability will follow [33].

Everyone Can Be a Leader

In traditional beliefs, a leader normally carries a superior, talented, and competent image. Only these leaders in high positions need to be equipped with leadership capability [34]. Conversely, Service Leadership Theory believes that everyone has his or her strengths; hence, has the potential to lead. There are a wide variety of service transaction, ranging from self-serving personal achievement at work to complex service such as managing a team. Everyone has the potential to utilize his or her skills and strengths and become a leader in the collaborative process. It is important to be open-minded to see every person’s potential. With such beliefs, service leaders will serve and lead in a humble and respectful manner, which can help them fully utilize their followers’ skills, enhance their performance, and nurture the followers to become service leaders as well.

Principle E = MC²

According to Chung and Elfassy [28], effective service leadership (E) is a function of one’s moral character (M), competencies (C), and caring disposition (C) (i.e., $E = MC^2$). It is believed that effective service leaders should demonstrate good leadership competence, interpersonal competence, intrapersonal competence, as well as domain-specific knowledge in order to guide their leadership practice [30]. Moral character emphasizes the importance to serve others with integrity and moral values while taking the lead. Caring disposition emphasizes one’s sincerity to learn and to meet the needs of others. It is believed that a caring leader will not sacrifice the needs and benefits of others to fulfill one’s own.

Although it is emphasized that the three determinants are equally important, morality and integrity appear to be essential features of effective leaders in the service industry. It is believed that the subordinates as well as service-receivers have difficulties trusting a person who lies, breaks promise, and neglects the feelings and needs of others, regardless of his or her actual work performance. These qualities are particularly important in certain industries such as counseling and nursing, where the nature of the service relies heavily on the interpersonal relationship. In addition, effective leaders serve not only clients but everyone in life, including one’s self, peers, subordinates, followers, and surroundings. Good leaders should always be “ready,” “willing,” and “able” to serve. They are continuously being evaluated by superiors, peers, subordinates, and all other service-receivers. Hence, instead of merely being skillful and knowledgeable, service leaders should demonstrate character

strengths, moral character, leadership competency, and caring social disposition in order to perform effectively.

Manufacturing Versus Service Economies in Contemporary World

Traditional leadership education emphasizes the importance of knowledge and skills in the field. Such concept applies very well in industrialized societies, when the operation system required hands-on skills. However, in recent decades, the manufacturing industry is gradually replaced by the rapidly growing service industry, especially in Hong Kong. As a result, skills are no longer the only quality that makes one a competent leader. It is suggested that the new concept of effective leadership focuses on whether one is moral and caring to followers and service recipients, as the basic concept is that the person himself/herself is considered as the “service” [34].

Distinction of Service Leadership Theory and Other Leadership Theories

Different from other leadership theories, Service Leadership Theory puts great emphasis on the “collaborative service-focused” attitude and behavior. In addition, Service Leadership Theory purposes seven core beliefs, including 1) service means serving “oneself, others, and systems”; 2) “everyone can be a leader”; 3) “leadership effectiveness is dependent on possessing relevant situational task competences plus being judged by superiors, peers, and subordinates as possessing character and exhibiting care”; 4) “leaders should ethically improving one’s competences, abilities, and willingness to help satisfy the needs of others”; 5) “high quality personal service should be consistently provided to everyone that one comes into contact with, including oneself”; 6) “service leadership is the world’s oldest, most competitive, and longest surviving business model”; and 7) “high-paying, high status positions and management promotions will go to people who have domain specific knowledge and skills plus service leadership competences, character, and care” [30, 31].

Development of the Service Leadership Knowledge Scale

A validated service leadership knowledge assessment tool is indispensable to measure and investigate the influence of service leadership knowledge. Moreover, it is also a key to evaluate participants’ knowledge gain through service leadership education. In view of the lack of such validated scales, the research team at The Hong Kong Polytechnic University (PolyU) conducted a project entitled “Development and validation of measures based on the service leadership model,” which entailed the construction and validation of a knowledge scale aimed at “capturing the essential knowledge points of service leadership in a format of multiple-choice questions” [30, p. 164]. Accordingly, the Long-Form Service Leadership Knowledge Scale (i.e., SLK-LF-200), which comprises 200 multiple-choice items covering fundamental service leadership knowledge points as outlined above (also see Table 2 for the domains and several sample items). Each item has a “correct” answer with one point whereas

participants get zero point if they answer incorrectly. By adopting an objective method, the Service Leadership Knowledge Scale could reliably and validly show one's knowledge level [35]. Through several validation studies as outlined below, the trimmed versions of the knowledge scale were also created which were shown to be valid and reliable.

Content Validation

The SLK-LF-200 was subjected to a content validation study administered by the research team at PolyU [30]. Four experts who were highly familiar with and involved in the development of the service leadership curriculum framework rated the 200 items based on three criteria, namely, i) relevance, ii) clarity, and iii) representativeness. The individual (I-CVI) and average scale content validation index (S-CVI/ave) based on experts' ratings on the three abovementioned criteria were employed to reflect the content validity of the scale. Both the I-CVI and S-CVI/ave metrics corroborated the meritorious content validity of the SLK-LF-200 on both the item and the scale levels [30].

Table 2. Initial Development of the Long-Form (SLK-LF-200) and Short-Forms (SLK-SF-50 and SLK-SF-40) Service Leadership Knowledge Scale

Steps	Details
Step 3: Development of the item pool (200 items) with reference to the main proposed domains	Seven key domains were conceptualized to be subsumed under the original, 200-item Long-form Service Leadership Knowledge Scale (SLK-LF-200). These include: General description of Service Leadership; Three realms of Service Leadership; Everyone can be a leader; Principle E = MC²; Manufacturing vs. service economies and current societal status; Distinction of Service Leadership and other leadership theories; Other knowledge points in SLAM curriculum framework. Three sample items are featured in the following: 2. According to the SLAM model, competence, _____, and _____ affect employees' loyalty and commitment. [Domain 1] A) fame; character; B) intelligence; care; C) intelligence; character; D) character; care (Correct answer: D); 27. Self-serving effort entails improving one's _____ in helping to satisfy others' needs. [Domain 2] A) fame; B) wealth; C) authority and power; D) competencies, abilities and willingness (Correct answer: D); 149. Which of the below is typically a desired behavioral attribute of employees in a manufacturing economy? [Domain 5] A) Flexible; B) Creative; C) Controllable; D) Unpredictable (Correct answer: C).
Step 4: Initial validation of the original scale (i.e., SLK-LF-200; 200 items)	The SLK-LF-200 was tested in a criterion-related validation study involving 161 PolyU students conducted in semester 2 of the 2014/15 academic year. Of those 161 participants 67 took the Service Leadership course before while the rest (N= 94) did not. Findings revealed that the former significantly performed better than the latter on 63 items of the SLK-LF-200. The first author of this paper commissioned a screening procedure on these 63 items, resulting in the removal of 13 items out of duplicity or face validity concern. Ultimately, a one-factor, 50-item short-form of Service Leadership Knowledge Scale (SLK-SF-50) was retained for the main study. See below for two sample items.
Step 5: Development of scale used in the main survey (i.e., SLK-SF-50; 50 items) and the major domains	<i>Single-factor, SLK-SF-50</i> 35. The two dimensions of social cognition include _____ and _____ . A) warmth; talent; B) warmth; competence; C) popularity; talent; D) popularity; competence (Correct answer: B) 43. The manufacturing economy emphasizes _____. A) Capital assets; B) Human assets; C) Financial assets; D) Social assets (Correct answer: A)

Note. All sample items were slightly re-worded to avoid familiarity effect.

Table 3. Refined scales based on exploratory factor analyses and confirmatory factor analyses

Steps	Details
Step 6: Refined scale based on exploratory factor analyses	N/A. No EFA was carried out.
Step 7: Refined scale based on confirmatory factor analyses (i.e., SLK-SF-40)	The whole working sample (N= 4,486) was utilized to validate the 50-item SLK-SF-50. Initial reliability analyses informed the deletion of 10 items due to low (i.e., < 0.30) item-total correlations. The resultant hypothesized one-factor, 40-item solution (i.e., SLK-SF-40) was accordingly subjected to CFA using the robust weighted least squares (WLSMV) estimator. The findings revealed the excellent fit of the SLK-SF-40 (i.e., CFI = 0.984; NNFI = 0.985; RMSEA = 0.029) to the data. The SLK-SF-40 also demonstrated excellent internal consistency ($\alpha = 0.94$, mean inter-item correlations = 0.28) as well as strong convergent validity (i.e., positive and significant correlations with all external criterion scales as well as other Service Leadership scales under validation). The SLK-SF-40 was accordingly accepted as the finalized solution. Three sample items are shown as follows: 8. A manager under the service economy wants to hire someone. Based on the Service Leadership model, which of the following advice would you give him/her? A) Hire for qualifications, train for character B) Hire for character, train for skills C) Hire for attitude, train for character D) Hire for efficiency, train for mindset (Correct answer: B); 22. In the four options below, which one belongs to an attribute of the intelligent quotient (IQ)? A) Raw power B) Attractiveness C) Sexual Orientation D) Problem-solving skills (Correct answer: D) 37. Which of the following statements is inconsistent with the concept of “respect”? A) Showing off one’s strength B) Accepting and appreciating differences C) Accepting and appreciating oneself D) Serving as a key element in nurturing authentic relationship (Correct answer: A)

Note. All sample items were slightly re-worded to avoid familiarity effect.

Criterion-Related Validation

The SLK-LF-200 was administered in the 2014-15 academic year involving 161 PolyU students [36]. The experimental group included 67 students who had taken credit-bearing training in service leadership before, while those who received no such training at the time of testing served as the control (N= 94). Results of the independent samples t-tests indicated that the experimental group scored significantly higher (i.e., all $t_s > 2.46$, $ps < .05$) in all seven component scores so as the total score (computed by summing all 200 items), indicating the criterion-related validity of the SLK-LF-200. Furthermore, analyses on the individual item

highlighted that the experimental group performed significantly better on 63 of those items (i.e., all χ^2 s > 2.46, ps < .05). These 63 items were subjected to a screening procedure conducted by the first author of this paper, leading to the deletion of 13 items after consideration of item redundancy and face validity. Consequently, 50 items (see Table 2 for the sample items) were retained to form the short version of Service Leadership Knowledge Scale (i.e., SLK-SF-50).

Large-Scale Validation

The SLK-SF-50 was administered in a large-scale validation study involving 4,486 undergraduates recruited from eight government-funded universities in Hong Kong. Initial reliability analyses suggested the removal of ten items with (i.e., < 0.30) item-total correlations. As a result, a single-factor, shortened 40-item solution (i.e., SLK-SF-40) was subjected to the Confirmatory Factor Analysis (CFA) using the robust weighted least squares (WLSMV) estimator. The goodness-of-fit indices underscored the excellent fit of this proposed solution with the data (see Table 3 for details). The SLK-SF-40 also demonstrated excellent internal consistency (α = 0.94, mean inter-item correlations = 0.28) and robust convergent validity, with the latter evidenced by the positive correlation between SLK-SF-40 and the list of theoretically-relevant constructs such as Servant Leadership [37] and Moral Self-concept [38]. Taken as a whole, this large-scale, joint-institution validation study underlined the adequacy of SLK-SF-40 (see Table 3 for the sample items) as a reliable, valid, and robust measurement tool in examining people's mastery of fundamental knowledge points on the Service Leadership Theory.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

Attitude is an important component of leadership qualities. Leaders who believe in the potential of the followers would allow more room for followers to make decisions. Leaders who believe in the importance of moral character would uphold moral principles in their work. With the gradual decline of manufacturing industries and the rise of service industries, there is a need to nurture leaders who can effectively lead in the challenging environment of service economies. In particular, fostering positive attitudes is an important task to be achieved. Unfortunately, measures of service leadership qualities are

* Corresponding Author's Email: cecilia.ma@polyu.edu.hk.

almost non-existent in the scientific leadership literature. In this chapter, the theory and concepts surrounding attitudes towards Service Leadership are outlined. The different steps underlying the development of the Service Leadership Attitude Scale are also described, including literature review, item development, initial validation and main survey.

INTRODUCTION

The 21st century has undergone paradigm shifts in the concepts, framework and application of leadership [1]. Hence, the traditional economic theory, which is based on the industrial paradigm, might not be applicable to the service world [2]. With the rapid evolution in information and communication technology, personalized services have become increasingly important. In fact, service has become the major economic sector in most developed nations. For example, service industry accounts for almost 80% of the economy in the United Kingdom and the United States [3]. In 2013, about 93% of the Gross Domestic Product in Hong Kong was comprised of a wide range of services, such as hotel and food services, banking and insurance, and professional and business services [4].

According to Shek, Chung and Leung [5], there are differences between manufacturing economy and service economy in terms of leadership qualities. For example, while leadership in manufacturing economy is more top-down, it is more bottom-up in service economy. Besides, service leaders need to be more sensitive to different needs and expectations of the customers [6]. Moving from a manufacture-oriented economy to a service-oriented economy means that the leaders need to be more responsive to customers' needs in the knowledge-intensive market [7].

THE NATURE OF SERVICE LEADERSHIP

With the rise of the service economy, customers have become part of the organizational system [8]. The increased diversity of customer backgrounds has imposed variability in the service provider-customer (supplier-customer) relationship [9] and led to a greater level of organizational uncertainty [7]. Hence, identifying and satisfying the needs of customers have become an integral cost of the firm [10]. In particular, emphasis on consumer experiences of services has become a key differentiator in this highly competitive world [11]. Leaders have to manage their organization effectively in order to stay ahead in the highly competitive market. Researchers proposed the use of "customer-centered" service-related competence models, which focus on the leadership behaviors and skills of Service Leadership to promote the quality of service.

Based on his experience in the service industries, Chung [12] proposed the Service Leadership Theory which posited that it is important to identify effective leadership competencies in the face of the competitive business environment. Under the framework of the Hong Kong Institute of Service Leadership and Management (SLAM), service leaders aim at "providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" [12, p. 5]. Compared with the conventional leadership theories (e.g., authentic leadership, transformation

leadership), Service Leadership focuses on changing the followers' beliefs and perceptions about themselves and promoting followers' positive behavior [13-15].

There are several unique characteristics of Service Leadership. First, meeting others' needs is a unique feature of Service Leadership. The major premise of the Service Leadership Theory is that leaders promote positive organizational outcomes by satisfying the followers' needs and facilitating their development. Through this empowering process, followers feel more attracted to their service leaders, see them as role models and thereby recognize their optimal level of performance. This is different from the leader-oriented and hierarchical nature of the previous leadership theories [5]. The de-emphasis of the hierarchical nature of leadership allows employees to act proactively and initiate changes from the bottom-up in order to address the needs at work [16]. Through this changing authority process, employees perceive themselves as part of the organization and feel that they have autonomy to exercise their personal judgment with greater job responsibilities, resulting in increasing job satisfaction and organizational commitment [17, 18]. Research studies show that adaptive employees reported better well-being [19, 20], a higher level of proactive skills [21] and greater organizational identification [16].

Second, development of followers' competence is another unique feature of the Service Leadership Theory. Effective leaders motivate others to excel themselves through achieving the organizational goals [22]. Service leaders encourage the followers to take challenges and to develop personal accountability. In order to differentiate themselves from others who are competitive and to keep staying ahead in the market, leaders seek ways to provide high-quality service for their customers [23, 24]. Providing high-quality service thus becomes a prerequisite for organizational success.

Third, high-quality service is provided when the service leaders possess effective intrapersonal and interpersonal competencies [5, 25, 26]. Effective service leaders should have high intrapersonal competencies in four areas, namely intelligence quotient (IQ), adversity quotient (AQ), emotional quotient (EQ) and spiritual quotient (SQ). IQ refers to the ability to critically analyze a problem and to search for innovative ways to solve the problem. AQ is defined as the ability to accept and overcome the difficulties by bouncing back from the challenges. EQ refers to the ability to understand one's own and others' emotions and to manage one's emotions when interacting with others. SQ refers to the ability to share the vision and mission with the followers and to solve problems by utilizing spiritual resources. Moreover, service leaders should have good interpersonal competencies so that they can communicate and work effectively with people of diverse backgrounds [27].

Fourth, moral character is an important attribute of effective service leaders. In particular, honesty and integrity are two major characteristics of a highly effective leadership [28]. Service leaders respond with trust and respect and express a strong preference for follower's needs over their own needs [29]. Ethical leaders are fully aware of the effects of their behavior on the development of the followers. They are always aware of their own moral values, perspectives and behaviors and transform their followers into moral agents [30]. Acting as change agents, service leaders transform followers into moral agents by behaving morally, developing a moral identity and creating ethical atmosphere [31]. Babalola et al. [32] highlighted the importance of ethical leadership in promoting followers' ability to handle conflicting situations. Empirical evidence [14, 33, 34] has shown the link between ethical leadership and followers' morality (i.e., moral identity, moral emotions, moral behaviors, and organizational commitment).

Fifth, effective service leaders must put the interests of the followers first. More specifically, the focus on helping and serving others is the central tenet of Service Leadership [35]. Service leaders show a genuine concern for the followers' welfare and focus on personalized care in creating an atmosphere that promotes the effectiveness of the team [29]. They serve as role models for intellectual stimulation and inspirational motivation [25]. Under this warm and supportive environment, employees feel secured and encouraged to explore innovative solutions in their work and to share their thoughts with their leaders [36].

Sixth, self-improvement is an important attribute of an effective service leader. Effective service leaders constantly evaluate their behavior and performance through reflection [37]. Self-reflection helps individuals to rethink or restructure their assumptions that underlie their own actions, beliefs and behaviors [38]. The significance of critical reflection has been demonstrated [39, 40]. Self-development is one of the significant competencies in the service industry [37, 41]. Customized service is characterized by complexity and utilization of specialized knowledge and skills [42, 43]. Effective service leaders are likely to rethink their own working performance, are more aware of others' needs and feel more motivated to promote personal growth. Reflection helps the individuals in personal growth and continuous improvement of leadership skills and knowledge. They are more willing to make changes and seek resources in order to adapt to the uncertain environment [37]. This leads to positive influence on the employees through the empowerment process [44, 45]. Employees become more welcome for changes and actively engage in continuous personal and professional development [46, 47].

Finally, the notion of "everyone can be a leader" is a defining characteristic of Service Leadership. In contrast to the concept of "elitist leadership" (i.e., only those who are talented can be leaders), the Service Leadership Theory emphasizes the notion that "everybody can be a leader." This notion suggests that everybody has potential to be a leader and the key is training and opportunities for development. This humanistic assumption is very empowering in nature, providing much space for development for the leaders and followers.

ASSESSMENT OF ATTITUDE TO LEADERSHIP

Facing the ever-changing business environment, new organization learning processes and informational activities have been rapidly increasing [2]. Leaders are expected to acknowledge individual differences and tailor their service to meet individual needs [15]. Yukl [48] argued that effective leadership may largely depend on the contexts [49]. The contemporary leadership theories often focus on how leaders' characteristics and behaviors influence the followers and organizational outcomes [50]. As such, some researchers began to study the factors related to effective leadership from the followers' perspective [17, 51-53]. In leadership research, attitude towards the leader refers to the degree of favorability one perceives a leader [54]. Wielkiewicz et al. [55] highlighted the importance of understanding of leadership development from the followers' perspective.

Recently, researchers have developed measurement tools to assess attitudes to leadership. For example, Wielkiewicz [56] developed the Leadership Attitudes and Beliefs Scale (LABS-III) which assessed both hierarchical thinking and systematic thinking about leadership. The scale has two dimensions with 14 items per subscale. This scale has been used to assess

college students' attitude towards leadership [55, 57, 58]. Also, the Operating Room Management Attitudes Questionnaire ORMAQ; [59, 60] was used to measure the attitudes towards six areas of leadership: assertiveness, teamwork, communication, leadership structure, awareness of personal limitations, and organizational issues. This scale has been tested in the fields of aviation [61] and medicine [59] but no factor analysis (e.g., confirmatory factor analysis) has been conducted.

Besides, the attitude towards service has been studied [23, 62, 63]. For example, customers' perception of service quality is an assessment of overall service excellence [23] and subjective evaluation of service quality has a close relationship with customer satisfaction [64]. Literature on service quality suggests that employees' attitude towards leaders are essential to determine customer satisfaction [65]. Parasuraman et al. [23] developed a 22-item tool assessing five dimensions of service quality, namely tangibles, reliabilities, responsiveness, assurance and empathy, and found support for the reliability and factor structure of the scale.

Unfortunately, although there are some measures assessing the attitude to service quality, existing scales for measuring the attitude towards Service Leadership are relatively scarce. For example, Wu [66] developed three items (e.g., "My service provider offers a larger choice of services for customers"; "My service provider satisfies customers' different needs with more diversified service"; "My service provider offers services of great variety") to assess Service Leadership and tested its impact on loyalty and brand equity via structural equation modeling which showed support for the reliability and validity of this construct. However, the coverage of these items on leadership qualities is not in-depth. In fact, despite the fact that service is playing an important role in the global economy, research on service development has lagged behind compared with the research on the manufacturing industry [67]. More research in this area can be helpful for the employers to understand which type of leadership style is the most suitable and appropriate in terms of the organizational and follower outcomes. Studying the attitudes of Service Leadership from employees' perspective is important because leaders need to create a positive atmosphere and accountability for employees so that organizational outcomes of interest (e.g., performance, satisfaction, leadership) can be achieved. Hence, psychometrically sound instruments would help researchers and practitioners understand individuals' attitudes towards Service Leadership.

Service is a process of applying one's knowledge and skills for the benefit of employees or customers [68]. Empirical findings showed that followers' attitudes toward leadership were positively related to follower positive outcomes, such as teamwork performance [62], job satisfaction [69] and organizational performance [70]. The establishment of psychometrically sound instruments will definitely increase our understanding of effective leadership in the service industry. Given the emergence of service-oriented economy which stresses the importance of intangible products, such as experiences and the quality of the goods, more research is warranted for helping us better understand effective leadership in this area.

Besides developing scales on Service Leadership, testing the psychometric properties of the developed scales is an important step. While the majority of research has mostly focused on assessing convergent/divergent validity [23] and content validity [71], little is known about the factor structure of the existing scales. More specifically, exploratory factor analysis has been commonly conducted when testing the factor structure [23, 56]. Although Service Leadership is perceived as a multidimensional concept [5, 25], a unidimensional tool has been

employed [66]. Clearly, more research should be conducted to test the generalizability of the Service Leadership Attitude Scale in different contexts and populations.

DEVELOPMENT OF THE SERVICE LEADERSHIP ATTITUDE SCALE

In Hong Kong, service industries account for nearly 93% of the GDP. Despite the importance of service industries, there is a gap in the development of Service Leadership in Hong Kong. In view of this deficiency, the Victor and William Fung Foundation made a donation of HK\$40 million to support the Service Leadership Education initiative with the participation of the eight institutions supported by the University Grants Committee. In each university, curriculum materials and subjects on Service Leadership were developed. With this good foundation, one unresolved question is on the availability of objective measures of Service Leadership knowledge, attitude and skills.

With further funding from the Victor and William Fung Foundation, the eight universities collaborated to develop scales on the Service Leadership knowledge, attitude and skills. As mentioned above, the Service Leadership Attitude Scale was developed within this context. As far as the Service Leadership Attitude Scale is concerned, several steps were involved:

- Step 1: Literature review on attitudes to leadership measures, particularly in different Chinese contexts
- Step 2: Literature review on Service Leadership
- Step 3: Development of the item pool (132 items) with reference to the main proposed domains
- Step 4: Initial validation of the original scale (132 items)
- Step 5: Development of scale used in the main survey (73 items) and the major domains
- Step 6: Refined scale based on exploratory factor analyses in the main survey (46 items)
- Step 7: Refined scale based on confirmatory factor analyses (46 items)

The details of different steps are outlined in Table 1-3. To assess the attitude to Service Leadership, Shek and colleagues [71] developed the 132-item long-form Service Leadership Attitude Scale (i.e., SLA-LF-132) and conducted the initial content validity test of the scale. This scale measures various aspects of service leadership, including service orientation, the belief that everyone can be a leader, leadership competence, moral character, caring disposition, and commitment to continuous improvement. The content validity of the scale has been established by the high content validity of the individual items and the overall questionnaires.

In this book, the findings on the psychometric properties of the Service Leadership Attitude Scale based on exploratory factor analyses are reported. We hope that from this book, it can be seen that the Service Leadership Attitude Scale possesses good psychometric properties and therefore can be used in research, assessment, education, evaluation and personnel decision contexts.

Table 1. Literature review on measures of leadership and service leadership

Steps	Details
Step 1: Literature review on attitudes to leadership measures, particularly in different Chinese contexts	Examples of references: – Casimir, G., & Waldman, D. A. (2007). A cross cultural comparison of the importance of leadership traits for effective low-level and high-level leaders: Australia and China. <i>International Journal of Cross Cultural Management</i>, 7(1), 47-60. – Chan, K. Y., & Drasgow, F. (2001). Toward a theory of individual differences and leadership: Understanding the motivation to lead. <i>Journal of Applied Psychology</i>, 86(3), 481-498. – Cheng, B. S., Boer, D., Chou, L. F., Huang, M. P., Yoneyama, S., Shim, D., ... & Tsai, C. Y. (2014). Paternalistic leadership in four East Asian societies: Generalizability and cultural differences of the triad model. <i>Journal of Cross-Cultural Psychology</i>, 45(1), 82-90. – Ho, J., & Nesbit, P. L. (2009). A refinement and extension of the self-leadership scale for the Chinese context. <i>Journal of Managerial Psychology</i>, 24(5), 450-476. – Lan, X. M., & Chong, W. Y. (2015). The mediating role of psychological empowerment between transformational leadership and employee work attitudes. <i>Procedia-Social and Behavioral Sciences</i>, 172, 184-191. – Liden, R. C., Wayne, S. J., Zhao, H., & Henderson, D. (2008). Servant leadership: Development of a multi-dimensional measure and multi-level assessment. <i>The Leadership Quarterly</i>, 19(2), 161-177. – Ling, W., Chia, R. C., & Fang, L. (2000). Chinese implicit leadership theory. <i>The Journal of Social Psychology</i>, 140(6), 729-739. – Spreitzer, G. M., Perttula, K. H., & Xin, K. (2005). Traditionality matters: An examination of the effectiveness of transformational leadership in the United States and Taiwan. <i>Journal of Organizational Behavior</i>, 26(3), 205-227.
Step 2: Literature review on Service Leadership	Examples of references: – Shek, D. T. L., & Li, X. (2015). The role of a caring disposition in service leadership. <i>International Journal on Disability and Human Development</i>, 14(4), 319-332. – Shek, D. T. L., & Lin, L. (2015a). Leadership and mentorship: Service leaders as mentors of the followers. <i>International Journal on Disability and Human Development</i>, 14, 351-359. doi: 10.1515/ijdhhd-2015-0456 – Shek, D. T. L., & Lin, L. (2015b). Intrapersonal competences and service leadership. <i>International Journal on Disability and Human Development</i>, 14(3), 255-263. – Shek, D. T. L., Lin, L., Leung, H., Yu, L., Ma, C. M. S., & Li, X. (2017). Content validation of the service leadership attitudes scale. In D. T. L. Shek, P. P. Y. Chung, L. Lin, & J. Merrick (Eds.), <i>Service leadership education for university students</i> (pp. 205-225). New York: Nova Sciences. – Shek, D. T. L., Ma, C. M. S., & Liu, T. T. (2015). Adolescent developmental assets and service leadership. <i>International Journal on Disability and Human Development</i>, 14(3), 275-283. – Shek, D. T. L., Ma, C. M. S., Liu, T. T., & Siu, A. M. H. (2015). The role of self-leadership in service leadership. <i>International Journal on Disability and Human Development</i>, 14, 343-350. doi: 10.1515/ijdhhd-2015-0455 – Shek, D. T. L., Yu, L., & Siu, A. M. H. (2015). Interpersonal competence and service leadership. <i>International Journal on Disability and Human Development</i>, 14, 265-274. doi: 10.1515/ijdhhd-2015-0407

Table 2. Initial development of the Long-Form (SLA-LF-132) and Short-Form (SLA-SF-73) Service Leadership Attitude Scale

Steps	Details
Step 3: Development of the item pool (132 items) with reference to the main proposed domains	Eight domains were proposed in 132-item long-form Service Leadership Attitude Scale (SLA-LF-132) including: [1] Service Orientation (e.g., Good leaders serve without expecting any rewards), [2] Everyone can be a leader (e.g., Only the elites can lead, reverse-item), [3] Distributed Leadership (e.g., Good leaders are open to challenge and criticism), [4] Employability (e.g., Lucrative leadership positions go to people who are eager and able to serve others), [5] Personalized Service (e.g., Sensitivity towards people's specific needs is an important trait for any leaders), [6] Attitudes towards Service (e.g., Service providers find it intrinsically enjoyable to render good-quality service), [7] Principle "E = MC²" (e.g., Moral character: Good leaders do not break promises; Competence: Good leaders make convincing arguments; Caring disposition: Good leaders are forgiving.), and [8] Commitment to Continuous Improvement (e.g., One can develop his/her ability to lead).
Step 4: Initial validation of the original scale (i.e., SLA-LF-132; 132 items)	The SLA-LF-132 was subjected to a quasi-experimental validation study in semester 1 of the 2016/17 academic year. A total of 208 PolyU students took the pre-test while 190 did the post-test. An exploratory factor analysis (EFA) was performed on 200 sets of pre-test questionnaires. Results of the EFA informed the retention of a 5-factor, 73-item solution (i.e., SLA-SF-73) which recorded good reliability and a significant and positive correlation with the short-form Service Leadership Knowledge Scale (SLK-SF-50). See below for the five factors extracted and two sample items for each factor.
Step 5: Development of scale used in the main survey (i.e., SLA-SF-73; 73 items) and the major domains	<i>Factor 1: Attitudes towards service and competences</i> 1. Good leaders serve with a genuine heart. 20. Good leaders can handle stressful situations calmly. <i>Factor 2: Attitudes towards moral character and caring disposition</i> 29. A good leader should be people-oriented. 39. Good leaders always tell the truth. <i>Factor 3: Attitudes towards self-reflection</i> 64. A good leader is self-restraint. 68. Genuine leaders are aware of their own strengths and weaknesses. <i>Factor 4: Everyone can be a leader</i> 5. Not everyone is able to lead others. (reverse-item) 6. Only the "best of the best" can lead. (reverse-item) <i>Factor 5: Implicit theory of leadership</i> 62. Leadership competence is not something that can be changed through learning. (reverse-item) 63. The ability to lead is inborn and not changeable. (reverse-item)

Note. All sample items were slightly re-worded to avoid familiarity effect.

Table 3. Refined scales based on exploratory factor analyses and confirmatory factor analyses

Steps	Details
Step 6: Refined scale based on exploratory factor analyses (i.e., SLA-SF-46E)	Nine items, which were demonstrated to possess low item-total correlation (i.e., <0.25), were dropped before the ensuing principal component analysis (PCA). Accordingly, the PCA was performed on the remaining 64 items of the SLA-SF-73 using a subset ($N = 2,246$) of the total sample ($N = 4,486$), resulting in a 7-factor structure demonstrated to be stable. Upon removing 18 items with loadings below 0.50, a 7-factor, 46-item solution (i.e., SLA-SF-46E) was retained to be subjected to CFA utilizing the other subset ($N = 2,240$). The SLA-SF-46E recorded excellent internal consistency and strong convergent validity, with the latter evidenced by its positive and significant correlations with the external criterion scales as well as other Service Leadership scales under validation. The seven factors of SLA-SF-46E include: Vision and competence (Factor 1), People Orientation (Factor 2), Caring Disposition (Factor 3), Ethical Role Model (Factor 4), Social Competence (Factor 5), Self-Reflection and Self-Understanding (Factor 6), and Positive Views about Human Beings (Factor 7). Three sample items are featured below: 28. Good leaders do not give in easily amidst adversity. (Factor 1) 38. Good leaders closely examine their thoughts and behaviors. (Factor 6) 41. Everyone has what it takes to be a leader. (Factor 7)
Step 7: Refined scale based on confirmatory factor analyses (i.e., SLA-SF-46)	The 7-factor SLA-SF-46E was subjected to CFA utilizing the Maximum Likelihood (ML) estimator, which showed acceptable fit to the data (i.e., CFI = 0.91; NNFI = 0.90; RMSEA = 0.048). Analyses were based on re-incorporating a previously removed seven-item subscale (from the PCA, due to low item-total correlations) back to the main factor structure. The 8-factor, 53-item factorial structure was subjected to CFA, whereby the fit indices (i.e., CFI = 0.87; NNFI = 0.86; RMSEA = 0.053) suggested an unsatisfactory fit. Inspection of the modification indices (MI) informed the removal of 7 items, due to their extreme MIs with multiple items on the same factor. The CFA was re-run on this 8-factor, 46-item structure where results suggested a much improved fit (i.e., CFI = 0.90; NNFI = 0.90; RMSEA = 0.054). Inspection of MIs revealed four pairs of parameters showing extreme covariance. After incorporating the correlation between errors for these four pairs of parameters, the findings corroborated the reasonable fit of this modified structure (i.e., CFI = 0.93; NNFI = 0.92; RMSEA = 0.041). This modified 8-factor, 46-item solution was accordingly accepted as the finalized solution (i.e., SLA-SF-46). The SLA-SF-46 comprises an <i>identical factor structure and labeling as the SLA-SF-46E</i>, with the addition of the eighth factor entitled “Unchangeable and Dark Human Nature”. Two sample items of this factor were shown below: 43. One’s ability to lead is inborn and hardly changeable (reverse-item). 45. People need to be checked to ensure they work as required (reverse-item). The SLA-SF-46 and the subscales showed good reliability and convergent validity, with the latter evidenced by the positive and significant associations with the external criterion scales and other Service Leadership scales.

Note. All sample items were slightly re-worded to minimize familiarity effect.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue “Development and validation of assessment tools on service leadership knowledge, attitude and behavior” edited

by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

The growth of the service economy in the contemporary world calls for a shift in the requirement of leadership qualities as compared to the manufacturing economy. However, contemporary leadership approaches and associated leadership behavior scales fail to fully encompass the required leadership qualities in the service economy. To satisfy the emerging needs of service economy which is predominant in Hong Kong, the Service Leadership Model has been proposed by the Hong Kong Institute of Service Leadership and Management Limited. To objectively assess service leadership behavior, the Service Leadership Behavior Scale (SLB) was developed. This chapter presents the background of the development of the Service Leadership Model, outlines its unique features as the

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

theoretical foundation of the SLB, documents the content of the initial SLB (i.e., SLB-LF-97) regarding its four key domains, and summarizes the findings surrounding the validation studies on the SLB.

INTRODUCTION

Leadership has a long history as a universal human behavior that has evolved to solve adaptive challenges throughout history [1]. In the contemporary world, leadership is still indispensable for almost every aspect of human life to function effectively in different areas, such as the economic, professional, military, religious, and political fields. Traditionally, leadership is conceived as a dynamic process in which a leader exerts influence on a group to work enthusiastically towards a collective goal [2, 3]. However, traditional leadership theories are no longer able to encapsulate the contemporary leadership needs due to the substantial change in economic structure over the world.

During the past few decades, along with the growing globalization and technological innovation, the structure of global economy has transformed from an industrial to a postindustrial mode, which is characterized by the expansion of service industries and the shrinking of manufacturing industries [4]. For example, from 2000 to 2016, the share of the services sector (e.g., trades, financial, personal services, etc.) in Gross Domestic Product (GDP) has increased from 64.9% to 69.3% in Japan, from 87.3 to 92.2 in Hong Kong, and from 39.8% to 51.6% in mainland China [5]. The manufacturing economy makes tangible goods from tangible raw materials through standardized procedures, which involve little human interactions or employees' personal input. In such circumstance, leadership is usually task-oriented and the top-down leadership style with highly centralized decision-making and minimal empowerment of followers appears to be adaptive due to its high standardization in mass production process [6]. In contrast, the service economy produces intangible services through personalized interactions between service providers and recipients, which call for distributed leadership and "service leaders" who are service-oriented and people-oriented [6].

A number of leadership scholars came to realize the emerging requirements of service-oriented economy and regarded leadership as a relational process between leader and followers instead of merely focusing on the leader [7]. In fact, different leadership models have been proposed in the postindustrial era to highlight adaptive leadership styles as well as vital qualities associated with each style. For example, the transformational leadership theory highlights ethical behavior and willingness to change of an effective transformational leader, who demonstrates idealized influence, inspirational motivation, personalized consideration, and intellectual stimulation [8]. Similarly, servant leadership theory primarily focuses on the leader's motivation to serve others and give priority to others' needs rather than their own [9]. Based on these leadership models, a considerable number of instruments have also been developed to measure leadership qualities in terms of knowledge, attitude, skill or behavior. For example, Multifactor Leadership Questionnaire [10] and Transformational Leadership Scale [11] are two examples of widely used leadership behavior scales.

Apart from these endeavors, some scholars have explicitly highlighted the importance of people skills (or interpersonal competence) in determining leadership effectiveness, such as communication and team work, which are also highly desired by contemporary employers [12]. Additionally, shared decision-making has been gradually adopted in organizations and

new assessment tools have been developed to capture effective empowering leader behaviors [13]. Furthermore, there is a growing tendency to emphasize the ethical parts of leadership and value moral behaviors and qualities such as integrity, trust, honesty and caring [14, 15].

The above-mentioned developments in leadership literature have deepened our understanding of the leadership requirements in a postindustrial age. Unfortunately, these advances are not adequate to satisfy the needs of service economy. Particularly, there are still three problems need to be addressed. First, previous leadership theories or related studies stressed some of the requirements for an effective “service leader”, such as interpersonal competence or ethical concerns. In other words, there is a lack of holistic leadership framework which can fully encompass required leadership qualities in service economy. Second, the existing leadership behavior scales developed based on previous theories are not able to comprehensively assess effective leadership behaviors in service economy. For instance, transformational leadership scales primarily assess a leader’s skills in satisfying the needs of followers and the organization by motivating and stimulating the followers as well as demonstrating ethical behaviors as a role model [11, 16]. However, other constructs desired in service economy such as a leader’s people skills and caring characteristics were not included. Third, as mentioned above, the service industry is of dominance in Hong Kong and growing rapidly in mainland China. However, little effort has been devoted to delineating what an ideal “service leader” is with specific reference to the Chinese culture. Most important of all, leadership assessment tools including behavior scales that are tailor-made for Chinese people are also missing. This issue is particularly relevant when we consider the possibility that culture values may shape one’s understanding of leadership which lead to particular ideal leadership practices in a specific culture [17, 18]. Indeed, some scholars have advocated for considering cultural settings and traditional Chinese wisdom in studying contemporary leadership practices in China [19].

To address these issues, Chung [20] proposed the notion of “service leadership” which is conceived as “satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments” [20]. Based on this notion, the Service Leadership Model was developed as a theoretical foundation to guide service leadership education in Hong Kong [21, 22]. Moreover, based on the Service Leadership Model, service leadership scales were tentatively developed for the purpose of assessing service leadership qualities and evaluating the effectiveness of service leadership education [23-25]. This chapter will focus on one of the service leadership assessment instruments, namely “Service Leadership Behavior Scale” (SLB). In following sections, we will briefly introduce several distinguishing features of the Service Leadership Model, based on which the item pool of the SLB was constructed. Second, the work surrounding the development and validation of the SLB will be outlined as well.

UNIQUE FEATURES OF THE SERVICE LEADERSHIP MODEL

The notion of service leadership incorporates and goes beyond the propositions of the extant leadership theories in the postindustrial era by adopting the strengths of previous theories and adding new arguments that are seldom mentioned in other leadership approaches.

In other words, service leadership theory shares some commonalities with other classic leadership approaches, while it has its own distinct features [6]. In particular, the uniqueness of the Service Leadership Model is manifested in its seven core beliefs, which systematically address what is effective service leadership as well as its determinants. As the seven core beliefs have been presented elsewhere in details [22], we briefly highlight several notable ideas of the Service Leadership Model, which reflect the paradigm shift in leadership mindset and serve as the principle references of the development of SLB.

First, the Service Leadership Model strongly emphasizes service orientation. Instead of treating leadership as a means of achieving personal and organizational success, the Service Leadership Model holds that leadership is “a service aimed at ethically satisfying the needs of self, others, groups, communities, systems, and environments” [22]. The underlying belief is that people evolved service propensities as an outcome of natural selection, so that both serving others and being served by others are inherent tendencies hard-wired into human minds [26]. Therefore, leadership prioritizing service can reach the hearts of people and thus satisfy the needs of others and the leaders themselves.

Second, in strong contrast to traditional conception of leadership that leaders were “great men and women” [27], the Service Leadership Model contends that “every day, every human occupies a position of leadership and possess the potential to improve his or her leadership quality and effectiveness” [22]. Primarily, the notion of “everyone can be a leader” enhances confidence in every individual and encourages all employees to contribute to decision-making, constituting a timely response to the needs of distributed leadership in service economy. Besides, to take a leading role effectively whenever is necessary, one should take initiatives and be well-prepared by continuously improving one’s abilities and willingness to provide high-quality service. Therefore, self-leadership by means of actively engaging in self-reflection, self-management, and self-improvement is regarded as indispensable for one to achieve leadership success.

Third, it is believed that “leadership effectiveness is dependent on possessing relevant situational task competencies plus being judged by superiors, peers, and subordinates as possessing character and exhibiting care” [22]. To elaborate, the Service Leadership Model places equal importance on the three fundamental determinants in defining effective service leadership (E), namely moral character (M), competence (C), and caring disposition (C) (i.e., $E = MC^2$). By covering a wide range of personal qualities in multiple dimensions, this framework extends beyond conventional leadership theories focusing on leadership skills and establishes a more holistic model to explain how these characteristics jointly contribute to effective leadership in service economy.

Finally, the Service Leadership Model incorporates the Chinese traditional values and integrates the philosophy of Buddhism, Confucianism, and Taoism, aiming to “help East meet West” [28]. Concerning the notion of “thinking globally while acting locally”, one can argue that when participating leadership in the Chinese communities, in addition to the universally preferred leadership qualities such as problem-solving and efficiency, an effective leader should also be aware of and demonstrate the qualities historically valued in the Chinese culture such as the ability to maintain harmony and have constant self-reflection.

Character strengths and service leadership. <i>International Journal on Disability and Human Development</i>, 14 (4), 299-307.

THE SERVICE LEADERSHIP BEHAVIOR SCALE (SLB)

With reference to the unique propositions of the Service Leadership Model, the research team at The Hong Kong Polytechnic University (PolyU), one of the eight universities funded by the University Grants Committee (UGC) in Hong Kong, developed a long-form of SLB

(SLB-LF-97) which consists of 97 items (see Table 1 for the list of related references). With each of the 97 items describing a specific leadership behavior desired in service economy, the SLB-LF-97 covers a wide range of constructs emphasized in the Service Leadership Model. Specifically, the content of the SLB-LF-97 can be subsumed to the following four key domains (see Table 2 for example items).

The first domain is “service provision” (4 items), which measures behaviors related to providing individualized service to others, going beyond one’s own interest, and being sensitive to others’ unique needs. These behaviors are indicative of a leader’s service mindset as well as automatic and genuine manifestation of care for others’ needs.

The second domain is related to the Principle “ $E = MC^2$ ”, which further includes three aspects: “competence” (38 items), “character” (14 items), and “caring disposition” (15 items). As a key determinant of effective service leadership, leadership competence in service economy has broad requirements including intrapersonal competencies [29] and interpersonal competencies [30]. More specifically, the SLB-LF-97 covers four types of intrapersonal competencies underlying effective leadership behaviors. First, 7 items are pertinent to intelligence quotient (IQ) which is manifested in problem-solving capacities, analytical abilities, independent and critical thinking, logical reasoning, and agile mindset. Second, 5 items measure emotional quotient (EQ), which serves as one of the most significant non-intellectual contributors to the success of personal life and career [31]. Behaviors pertaining to EQ in the SLB-LF-97 includes understanding, recognizing and managing emotions of oneself and others. Third, 4 items are on the adversity quotient (AQ), which reflects one’s ability not only to withstand loss, misfortune, or other types of adversity but also to rebound stronger than before [32]. AQ is conceptually similar to the idea of resilience and possessing AQ is deemed vital to one’s leadership quality [29]. The last type of intrapersonal competencies covered in the SLB-LF-97 is spiritual quotient (SQ), which is closely related to meaning, purpose and values in one’s life [33]. In the SLB-LF-97, 3 items assess the extent to which one can utilize meaning, faith, and other spiritual resources to solve problems.

Regarding interpersonal competencies, scholars have proposed a five-dimensional framework including “initiating relationships”, “self-disclosure”, “asserting displeasure with others’ actions”, “providing emotional support”, and “managing interpersonal conflict” [34]. These five dimensions have been further adapted and enriched based on Chinese culture and philosophy. Specifically, an effective service leader should be people-oriented (“*yi ren wei ben*” – people as the central focus) and able to maintain positive social relationships with others. In addition, a good service leader is expected to demonstrate good communication skills in order to build collaborative relationships with teammates and assert one’s personal thoughts and feelings when having conflicts with others. Apart from maintaining healthy social relationships, a competent service leader with adequate interpersonal competencies would also appreciate different opinions (“*he er bu tong*” – peace within diversity) and resolve interpersonal conflicts in a constructive way. As such, six revised components concerning one’s ability dealing with interpersonal competencies are intrinsic to the SLB-LF-97: “passionate about people” (2 items); “positive social relationships” (5 items); “assertiveness” (3 items); “collaboration and cooperation with people” (2 items); “conflict resolution” (3 items); and “communication skills” (4 items).

Table 2. Initial development of the Long-Form (SLB-LF-97) and Short-Form (SLB-SF-65) Service Leadership Behavior Scale

Steps	Details
Step 3: Development of the item pool (97 items) with reference to the main proposed domains	Four domains were proposed to be subsumed under the 97-item long-form Service Leadership Behavior Scale (SLB-LF-97) including: [1] Service Provision (e.g., I work for the best interests of others instead of just for my own benefit), [2] Principle “E = MC²” included three aspects (e.g., Moral character : I am aware of my weaknesses; Competence : I am able to argue logically; Caring disposition : I show kindness to those whom I had conflict with before.), [3] Commitment to Continuous Improvement (e.g., I am self-disciplined), and [4] Distributed Leadership (e.g., I respect others’ ideas and suggestions).
Step 4: Initial validation of the original scale (i.e., SLB-LF-97)	The SLB-LF-97 was subjected to a validation study involving 231 PolyU students in November 2016. Results of the exploratory factor analysis (EFA) informed the retention of 65 items, forming the trimmed version of the scale (i.e., SLB-SF-65). The SLB-SF-65, alongside its twelve factors (see the list below), overall demonstrated good internal consistency and robust convergent validity. See the paper by Shek, Ma, and Lin in this book.
Step 5: Development of scale used in the main survey (i.e., SLB-SF-65) and the major domains	Factor 1: Problem-Solving 6. I am capable of independent thinking. Factor 2: Self-leadership and Life-long Learning 47. I spare no effort in achieving my goal. Factor 3: Non-cognitive Intrapersonal Competences 10. I am often aware of my emotions. Factor 4: Distributed Leadership 65. I hold others’ ideas and suggestions in high regard. Factor 5: Integrity 31. Others often see me as a reliable person. Factor 6: Care Provision 44. I do not miss any chances to help others grow. Factor 7: Concern 36. I have no problem sharing my weaknesses with others. Factor 8: Self-Reflection 54. I often reflect on my expertise and shortcomings. Factor 9: Service Provision 3. I serve others based on their specific needs Factor 10: Positive Social Relationship 28. I am capable of developing a rapport with others. Factor 11: Communication Skills 24. I am adept at working with others. Factor 12: Fairness 35. Treating those around me equally is what I always do.

Note. All sample items were slightly re-worded to avoid familiarity effect.

“Character” (14 items) is another aspect under the second domain in the SLB-LF-97, which is also one of the three principle determinants for effective service leadership [35]. Drawing on the groundwork of defining universally valued character strengths (e.g., integrity and humility) in Western societies [36] and also taking into account traditional Chinese virtues such as benevolence (“ren”), affection (“ai”), and forgiveness (“shu”) [37], the SLB-LF-97 synthesizes strengths of character in both cultures and operationalizes the virtues of an effective service leader using “integrity” (5 items), “humility” (4 items), “fairness” (3 items), and “acting as an ethical role model” (2 items).

Table 3. Refined scales based on exploratory factor analyses and confirmatory factor analyses

Steps	Details
Step 6: Refined scale based on exploratory factor analyses (i.e., SLB-SF-48)	Utilizing a subsample (N = 2,246) of the whole dataset (N = 4,486), a principal component analysis (PCA) was performed on the SLB-SF-65. Findings of the PCA suggested that six factors can be extracted with 48 items (loadings above 0.50) retained for the trimmed scale (i.e., SLB-SF-48). The SLB-SF-48 was revealed to be a stable factorial structure and internally consistent. The SLB-SF-48 was also correlated positively and significantly to other external criterion scales and other Service Leadership scales under validation, thereby corroborating its convergent validity. The six factors, each of which forms a subscale, include: [1] Self-improvement and Self-reflection (e.g., I have a habit of reflecting my work and life), [2] People and Principles Orientation (e.g., I allow others to decide how to get things done), [3] Resilience (e.g., I have a sense of purpose in my life which helps me cope with stressful situations), [4] Social Competence (e.g., I can maintain positive relationships with others), [5] Problem-Solving (e.g., I am good at analyzing problems that I come across), and [6] Mentorship (e.g., I can facilitate other's growth by mentoring them). Details can be found in the paper by Shek and Ma in this book.
Step 7: Refined scale based on confirmatory factor analyses (i.e., SLB-SF-38)	The SLB-SF-48 was subjected to CFA on the other subsample (N = 2,240) using the Maximum Likelihood (ML) estimator. The results overall suggested that the fit was unsatisfactory (i.e., CFI = 0.86; NNFI = 0.86; RMSEA = 0.061). Ten items with extreme modification indices (over 40.0) with multiple items on the same factor were removed. The resultant 38-item structure was again subjected to CFA. Findings revealed a considerably better fit (i.e., CFI = 0.90; NNFI = 0.89; RMSEA = 0.056). Furthermore, three pairs of parameters showed particularly large covariance. Accordingly, the correlation between errors was incorporated for these three pairs of parameters. Results of the CFA performed on this modified 38-item solution (i.e., SLB-SF-38) demonstrated that the model fit adequately (i.e., CFI = 0.92; NNFI = 0.91; RMSEA = 0.055) with the data. The SLB-SF-38, which shared the same factorial structure and labeling as SLB-SF-48, was accepted as the final solution. The SLB-SF-38 and the six subscales recorded good internal consistency and were shown to be positively and significantly associated with all external criterion scales. The SLB-SF-38, inclusive of the subscales, also correlated significantly and positively to other Service Leadership scales, further supporting its convergent validity.

Note. All sample items were slightly re-worded to avoid familiarity effect.

The last aspect of the second domain is “caring” (15 items). A caring service leader is supposed to show concern to others as well as to oneself [38]. By referring to the Chinese culture, the SLB-LF-97 measures one’s caring disposition from two aspects: the qualities of concern (“guan xin”) including “empathy” (3 items) and “compassion” (3 items); and the qualities of providing care (“zhao gu”) for others in terms of “loving others” (3 items), “supporting others” (3 items), and “developing others” (3 items).

The third domain is “commitment to continuous improvement”. As aforementioned, one of the key features of the Service Leadership Model is its emphasis on the need for continuous improvement, through which everyone can be a leader at a certain time [39]. Besides, only through continuous professional and personal improvement could one be well prepared to serve oneself as well as others. Therefore, effective service leaders should put self-development efforts “aimed at ethically improving one’s competencies, abilities, and willingness to help satisfy the needs of others” [22] in terms of promoting self-leadership (5 items), engaging in constant self-reflection (4 items), and committing to life-long learning (4 items).

“Distributed leadership” is the last domain, which also represents a timely response to the belief that “every day, every human occupies a position of leadership and possesses the potential to improve his leadership quality and effectiveness” [22]. Distributed leadership in the service economy has two attributes. First, leaders encourage every team member to voice out and take initiatives and empower them to contribute to decision-making of a team. Second, leaders would trust and respect their followers by recognizing their views and trusting their abilities. As such, the domain of “distributed leadership” in the SLB-LF-97 includes three elements: “shared decision-making” (5 items), “empowerment of teammates” (4 items), and “trust and respect” (4 items).

The SLB-LF-97 is developed as a component of the scale development project supported by the Victor and William Fung Foundation. Several validation studies have been carried out to streamline the scale and provide evidence for its reliability and validity (see Table 2 and Table 3). It is worth noting that two papers based on the validation studies are included in this book and other related papers are under preparation. To show a full picture of the development of the Service Leadership Behavior Scale, the section below will briefly outline findings of these validation studies.

VALIDATION OF SERVICE LEADERSHIP BEHAVIOR SCALE (SLB)

First, an initial validation study involving 231 PolyU students was conducted to refine the original scale, i.e., SLB-LF-97. Based on the results of the exploratory factor analysis (EFA), 65 out of the 97 items were retained, forming the short form of the scale (i.e., SLB-SF-65). In addition, the SLB-SF-65 alongside its 12 sub-scales (e.g., “problem-solving”, “self-leadership and life-long Learning”, and “distributed leadership”.) demonstrated good internal consistency and robust convergent validity, as indicated by the significant positive correlations with several theoretically linked constructs such as moral self-concept and leadership efficacy. A paper by Shek, Ma, and Lin documenting the psychometric properties of the SLB-SF-65 is included in this book.

Second, using the refined SLB-SF-65, a large-scale validation project was jointly carried out in the eight UGC-funded universities in Hong Kong including PolyU, with the adoption of both exploratory factor analyses (EFA) and confirmatory factor analyses (CFA). Utilizing a subsample ($N = 2,246$) of the whole dataset ($N = 4,486$), the EFA revealed a six-factor solution with 48 items (loadings above 0.50) being retained. These 48 items formed the trimmed scale (i.e., SLB-SF-48) as well as the six subscales named as “self-improvement and self-reflection”, “people and principles orientation”, “resilience”, “social competence”, “problem-solving”, and “mentorship”. The SLB-SF-48 was also found to have good reliability and convergent validity. Details of this study and findings of EFA can be found in another paper by Shek and Ma in this issue as well.

Third, the SLB-SF-48 was further subjected to CFA using the other subsample ($N = 2,240$). After removing 10 items with extreme modification indices (over 40.0), the resultant 38-item structure demonstrated acceptable model fit. Thus, the 38-item scale (i.e., SLB-SF-38), which shared the same 6-factor structure and labelling as SLB-SF-48, was accepted as the final solution. Likewise, the SLB-SF-38 and its six subscales showed good internal

consistency and convergent validity. An article presenting the CFA and related findings is under preparation. Information on the related analyses can be seen in the User Manual.

Generally speaking, a well-developed and validated leadership behavior scale regarding service leadership is essential for educators and researchers to empirically evaluate individuals' service leadership qualities and assess their changes after service leadership education. By doing so, the Service Leadership Model as well as its associated propositions such as the principle "E = MC²" can be further validated as well. As such, the development as well as the validation studies for the Service Leadership Behavior Scale not only provide a pioneering assessment tool for contemporary service leadership education, but also represent an important progress in the journal of consolidating the Service Leadership Model.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

Using a sample of 231 students recruited from The Hong Kong Polytechnic University (PolyU), this paper reports the findings of a validation study for the 97-item long-form of the Service Leadership Behavior Scale (SLB-LF-97), which was specifically designed to measure the behavioral characteristics of a quality Service Leader. Results showed that the SLB-LF-97 had high internal consistency and convergent validity. Exploratory factor analysis revealed that 12 factors were extracted from the data, with 65 items retained to form the short-form of the inventory (SLB-SF-65). Both the long-form (SLB-LF-97) and the short-form (SLB-SF-65) of the scale showed excellent

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

internal consistency, with the latter demonstrating robust convergent validity as shown by its significant positive correlation with several theoretically linked constructs.

INTRODUCTION

Regarding the transformation of manufacturing-driven to service-driven and knowledge-based economies typical of advanced capitalist societies [1-3], Hong Kong has undergone the most complete and swift transition, despite the absence of any strategic political planning [4]. As such, Po Chung, Chairman of the Hong Kong Service Leadership and Management Limited (HKI-SLAM), strongly advocated the necessity to teach undergraduates in Hong Kong about effective leadership in a service economy which is vital to their career aspirations as well as personal growth [3, 5]. Indeed, the HKI-SLAM is committed to the development of sustainable Service Leadership education (i.e., SLAM curriculum framework) tailored to tertiary institutions in Hong Kong [6, 7].

Against such a background, a multi-year project entitled the “Fung Service Leadership Education Initiative (FSLEI)” was implemented in eight local universities funded by the University Grants Committee (UGC). The FSLEI was conceived with the financial support of the Victor and William Fung Foundation and the collaborative effort of the HKI-SLAM and the UGC. Under the FSLEI, each participating institution independently designs curriculum materials and programs on Service Leadership based on the SLAM curriculum framework [6-8]. Particularly, Chung [9, 10] contended that there are three fundamental building blocks of effective Service Leadership (**E**), namely, *competence* (**C**₁; “Expertise” dimension), *moral character* (**M**; “Moral” dimension), and *caring disposition* (**C**₂; “Compassion” dimension). Besides, the seven Core Beliefs [i.e., CBs 1 to 7] pertaining to Service Leadership and Management outlined by HKI-SLAM [11] also underlie the theoretical foundation of Service Leadership education under the FSLEI [7].

With the purpose of filling the research gap on the evaluation of leadership education [8, 12], as well as facilitating the objective assessment of qualities of an effective Service Leader [13], the research team at The Hong Kong Polytechnic University (PolyU) embarked on a project entitled “Development and validation of measures based on the Service Leadership model (i.e., “The Project” hereafter)” [14]. Through the construction and validation of three scales on attitude, behavior, and knowledge which constitute the three defining attributes of an effective Service Leader [12], Shek and colleagues [14] developed three related assessment tools. The present paper reports the findings of a validation study of the long-form of Service Leadership Behavior Scale (SLB-LF-97).

Designed to examine the “kind of behavioral qualities a Service Leader should demonstrate” [14], the SLB-LF-97 comprises 97 English items developed based on the SLAM curriculum framework, 25 principles of Service Leadership [9], 12 dimensions of a Service Leader [10], and other relevant publications from the leadership and management literature [15-17]. Each item describes a specific leadership behavior related to the Service Leadership model. Participants were asked to use a six-point Likert scale (1: very dissimilar to me; 6: very similar to me) to evaluate whether each statement appropriately describes one’s behavior in a situation which warrants his/her leadership (see Table 1 for the sample items). Resembling Yukl’s [18] proposed a hierarchical taxonomy of leadership behaviors, the SLB-LF-97 covered a wide range of component behaviors subsumed under four “metacategories”.

These “metacategories” included, i) service provision, ii) principle **E** (effective leadership) = **MC**² (Moral character * Competence * Caring disposition), iii) commitment to continuous improvement, and iv) distributed leadership.

Table 1. Four sample items of the SLB-LF-97

Items	Very Dissimilar to Me	Moderately Dissimilar to Me	Slightly Dissimilar to Me	Slightly Similar to Me	Moderately Similar to Me	Very Similar To Me
10. I can make convincing arguments.	1	2	3	4	5	6
18. I draw meaning from undesirable experience.	1	2	3	4	5	6
58. I find it hard to think from other people's perspectives. (Reverse-item)	1	2	3	4	5	6
89. I usually do not let others participate in the decision-making process. (Reverse-item)	1	2	3	4	5	6

Note. These sample items were slightly modified out of copyright concern.

The SLB-LF-97 was also examined in a content validation study which is described in detail in another paper under preparation. While it is crucial in scale development to examine content validity, which informs how each item represents the construct being measured [19], it is equally important to establish the convergent validity of the measure, which can be derived from “correlations with measures purporting to measure related constructs” [20, p. 179], as well as internal consistency for the measurement tool under validation. Hence, as a preliminary step paving the way for the main study, the present study utilized a sample of 231 PolyU students to examine the reliability, factorial validity, and convergent validity of the SLB-LF-97.

OUR STUDY

A total of 231 students at The Hong Kong Polytechnic University (PolyU) completed the questionnaire used in the present study via an online survey platform. Seventeen questionnaires were excluded from the working sample due to concern about response quality. Amongst the 214 valid questionnaires, 60 (28.0%) were male respondents while 154 (72.0%) were female respondents. Most participants (55.1%) were aged 20 to 24 years (mean age: 20.0 years, SD: 1.86). The majority of respondents had previous work experience (86.0%), had taken one (or more) credit-bearing Service Leadership course(s) at PolyU (52.9%), and received other prior leadership training (32.2%). Taken as a whole, 76.6 % of respondents claimed to possess “some” or “a lot of” knowledge about Service Leadership. Finally, 49.5% were admitted to PolyU based on performance on the Hong Kong Diploma of Secondary Education Examination (HKDSE). Details regarding other basic demographics of the sample are featured in Table 2.

Table 2. Demographic information for the current working sample (N= 214)

Demographic variables		N= 214
Gender	Male	60 (28.0%)
	Female	154 (72.0%)
Age group	15 to 19 years	92 (43.0%)
	20 to 24 years	118 (55.1%)
	25 to 29 years	4 (1.9%)
Year commencing on one's undergraduate study	2016	103 (48.1%)
	2015	52 (24.3%)
	2014	23 (10.7%)
	2013	30 (14.0%)
	2012 or before	6 (2.8%)
Faculty	Faculty of Applied Science and Textiles	17 (7.9%)
	Faculty of Business	36 (16.8%)
	Faculty of Construction and Environment	27 (12.6%)
	Faculty of Engineering	60 (28.0%)
	Faculty of Health and Social Sciences	47 (22.0%)
	Faculty of Humanities	3 (1.4%)
	School of Design	1 (0.5%)
	School of Hotel and Tourism Management	22 (10.3%)
Number of credit-bearing Service Leadership (SL) courses taken*	Others	1 (0.5%)
	0	101 (47.2%)
	1	105 (49.1%)
	2	7 (3.3%)
	3	1 (0.5%)
Participated in the non-credit bearing "Silk Road Youth Leadership Programme"	4	0 (0%)
	Yes	3 (1.4%)
Other leadership training or workshops taken?	No	211 (98.6%)
	Yes	69 (32.2%)
Previous work experience	No	145 (67.8%)
	Yes	184 (86.0%)
Self-proclaimed SL knowledge	No	30 (14.0%)
	No knowledge	11 (5.1%)
	Little knowledge	39 (18.2%)
	Some knowledge	128 (59.8%)
	A lot of knowledge	36 (16.8%)
Leadership position ever taken?	All the knowledge	0 (0%)
	Yes	152 (71.0%)
Entrance Exam	No	62 (29.0%)
	Hong Kong Diploma of Secondary Education Examination (HKDSE)	106 (49.5%)
	Hong Kong Advanced Level Examination (HKALE)	4 (1.9%)
	National College Entrance Examination (NCEE) in mainland China	21 (9.8%)
	Associate Degree/Higher Diploma in Hong Kong	35 (16.4%)
Grade Point Average**	Others (e.g., SAT, Cambridge International Examinations)	48 (22.4%)
	Average Grade Point Average (GPA) out of 4.50 (SD)	3.1 (0.5)
Time of completion	Average time (in minutes) taken to complete the survey (SD)	25.0 (6.7)

Note. * The list of credit-bearing SL courses offered by PolyU included i) APSS 1L01 Tomorrow's Leaders, ii) APSS 1A22 Promotion of Leadership Qualities in University Students, iii) APSS 1A21/1A21 M Service Leadership, and iv) APSS 2S09 Service Leadership through Serving Children and Families with Special Needs.

** As the present study was conducted in November 2016, this average GPA metric was computed based only on the responses given by 111 students who did NOT start their undergraduate study at PolyU in 2016.

Procedures

The study was conducted in a computer lab with each student seated in a separate cubicle. Participants were instructed to access the electronic survey implemented via the mySurvey@PolyU electronic survey system. The rationale of the study, instructions on how to participate, the principles of voluntary participation and withdrawal, and the pledge of data confidentiality were detailed in the invitation documents and on the e-survey. It was emphasized during the invitation and before the start that 30 minutes would be required for students to conscientiously complete the whole questionnaire. Each respondent was offered for his/her participation a supermarket gift voucher valued at HK\$50 (USD\$6.40) and an opportunity to win an iPad Air 2 via a lucky draw. Participants indicated whether they consented to join the study (or to withdraw) on the opening page.

We used time of completion as a proxy for gauging participants' seriousness in completing the survey. Specifically, we regarded responses submitted within half of our suggested time (i.e., 30 minutes) as invalid. Accordingly, 17 cases with a completion time below 15 (mean: 13.3, SD: 2.6) minutes were deleted, resulting in 214 valid cases.

Instruments

The present e-survey consists of items of the long-form of the Service Leadership Behavior Scale (i.e., the 97-item SLB-LF-97). As part of the project entitled "Development and validation of measures based on the Service Leadership model" [14], the SLB-LF-97 was developed based on the SLAM curriculum framework, 25 principles of Service Leadership [9], 12 dimensions of a Service Leader [10], and other published papers from the leadership literature [e.g., 17, 21]. The SLB-LF-97 is in English with a six-point Likert scale (1: very dissimilar; 6: very similar). Each item describes a certain leadership behavior whereby participants rate how each description resembles their own behaviors when they assume leadership roles in formal (e.g., workplace) or informal (e.g., family) contexts. Four sample items are illustrated in Table 1.

To assess the convergent validity of the SLB-LF-97, six additional measures based on the personality and leadership literature were administered alongside the SLB-LF-97. These validated criterion inventories included the Revised Servant Leadership Profile (RSLP; 20 items), the Paternal Leadership Scale (PTL; 5 items), the Leadership Attitude and Belief Scale (LABS; 28 items), the Interpersonal Reactivity Index (IRI; 14 items), the Moral Self-Concept Scale (MSC; 8 items), and the Leadership Efficacy Scale (LEF; 8 items). There were also a few closed-ended and open-ended items probing into the demographics of the respondents.

1. **Revised Servant Leadership Profile (RSLP):** The RSLP was developed by Wong and Page [22] as a self-assessment tool which assesses *Servant Leadership* as a multifactorial construct. Of the eight factors outlined in Wong and Page's [22] revised model of *Servant Leadership*, 20 items from five factors considered relevant to the SLAM framework were included in the present study. These five factors

included *Empowering and developing others* (5 items), *Serving others* (7 items), *Open, participatory leadership* (2 items), *Inspiring leadership* (2 items), and *Courageous leadership* (4 items). The RSLP operates on a seven-point Likert scale, with a higher composite score denoting a higher propensity to exhibit *Servant Leadership* behaviors. The RSLP was demonstrated to possess excellent internal consistency ($\alpha = 0.93$; mean inter-item correlations = 0.42).

2. **Paternalistic Leadership Scale (PTL):** Developed by Aycan and associates [23], the PTL (5 items) measures *Paternalism* as a leadership style epitomized by a strong sense of hierarchy combined with a fatherly benevolence and moral integrity bestowed upon followers [24, 25]. Items were rated on a six-point Likert scale, with a higher score illustrating a greater alignment with the mentality of a paternalistic leader. Reliability analyses underlined the acceptable internal consistency of PTL in the current study ($\alpha = 0.79$; mean inter-item correlations = 0.43).
3. **Leadership Attitude and Belief Scale (LABS):** Developed by Wielkiewicz [17] as a measure of college students' "attitudes and beliefs about regarding the nature of leadership" (p. 337), the LABS is formed of two independent dimensions probing into two distinct thinking styles regarding what leadership should be about. They included the *Systemic Thinking Scale* (ST; 14 items) which examines people's construal of leadership as a distributed and decentralized process, as opposed to the *Hierarchical Thinking Scale* (HT; 14 items) which assesses individuals' interpretation of leadership as involving centralization and hierarchies. Items were rated on a five-point Likert scale, with higher scale scores reflecting a greater likelihood to adopt a certain construal of the nature of leadership. Both ST ($\alpha = 0.84$; mean inter-item correlations = 0.28) and HT ($\alpha = 0.83$; mean inter-item correlations = 0.26) recorded meritorious reliability in the present study.
4. **Interpersonal Reactivity Index (IRI):** As a cross-culturally validated assessment tool [see 26-28], the IRI comprises four subscales with each assessing a dimension of empathy [29]. Subscales *Perspective Taking* (PT; 7 items) and *Empathic Concern* (EC; 7 items) were adopted in this study. Participants rated the 14 items on a five-point Likert scale, with higher subscale and composite scores indicating higher empathy, which constitutes the roots of compassion as a key dimension of a Service Leader [10]. Cronbach's alpha for subscales PT and EC and the composite IRI score were 0.66, 0.67, and 0.73, respectively.
5. **Moral Self-Concept (MSC):** As a subscale under the Chinese Adolescent Self-Esteem Scales [30], the MSC specifically examines students' self-evaluation on areas including i) *Conduct and virtues*, ii) *Self-control and discipline*, and iii) *Altruism*. Participants rated the eight items using a seven-point Likert scale, with a higher composite score representing the respondent's perceived significance of *morality* to oneself, which is a fundamental attribute of leadership effectiveness according to the SLAM curriculum framework [11]. The MSC was shown to possess a good internal consistency in the present study ($\alpha = 0.88$; mean inter-item correlations = 0.49).
6. **Leadership Efficacy Scale (LEF):** Developed by Murphy [31], the 8-item LEF constitutes a self-report inventory in which respondents rate their self-perceived capacity to lead. The LEF operates on a five-point Likert scale, with a higher score indicative of one's "level of confidence in the knowledge, skills, and abilities

associated with leading others” [32, p. 669]. Reliability assessment again highlighted a good internal consistency of the LEF ($\alpha = 0.84$; mean inter-item correlations = 0.41).

Data Analysis Plan

To explore the dimensionality of SLB-LF-97, we performed the exploratory factor analysis (EFA) in this validation study. Specifically, the present EFA was conducted using the principal axis analysis (PAA) with Promax rotation ($\kappa = 4$). Tabachnick and Fidell [33] argued that PAA should be preferred for studies which attempted to reach an uncontaminated theoretical solution and were designed on the basis of several underlying theoretical constructs. Both these criteria matched well with the objectives and nature of the present study. SPSS statistics version 24.0 (IBM) was used to perform descriptive analyses as well as internal consistency, convergent validity, and factorial validity.

Factorial Validity Analyses

Owing to the large number of survey items involved, we adopted the Minimum Average Partial (MAP) [34] to determine the number of factors to extract a priori as to avoid the issue of over-extraction [35]. The MAP, which involves “comparison of systematic and unsystematic variance remaining in a correlation matrix after each factor is extracted” [36, p. 108], has been shown in a simulation study to be the most accurate amongst a host of alternative extraction methods [36]. The MAP was administered using the SPSS R-Menu V 2.0 [see 35].

With the purpose of simplifying and enhancing the interpretability of the final factorial solution, we applied two exclusion criteria to help downsize the scale. First, double-loaded items were removed [37]. Second, only non- double-loaded items that are of substantive importance (i.e., highest loadings $\geq |0.40|$) to a factor were retained [see 19]. Table 3 details the post-rotation factor loadings of each item and other relevant statistics.

Reliability and Convergent Validity Analyses

We referred to the Cronbach’s alpha values and mean inter-item correlations as indicators of internal consistency of the scale and the factors derived (i.e., subscales). As regards the assessment of convergent validity, the composite scores calculated by averaging participants’ responses of both the scale and subscales were correlated with the six concurrently administered external criterion measures. Specifically, we hypothesized a positive and significant association between the behavior scale (and the subscales) and the i) RSLP (i.e., Hypothesis 1), ii) LEF (i.e., Hypothesis 2), iii) MSC (i.e., Hypothesis 3), and iv) IRI (i.e., Hypothesis 4), considering that *Servant Leadership*, *leadership efficacy*, *morality*, and *empathy*, respectively are all constructs theorized to underline the behavioral standard of a bona fide Service Leader [9, 10].

Table 3. Factor loadings of the SLB-LF-97 (N = 214)

Note. N = 214. M: mean scores; SD: standard deviation. Bold and underlined values are the highest loadings by a variable which are retained for subsequent analyses. Item SLB-89 was excluded here due to its unacceptable individual measure of sampling adequacy in the initial PAA (i.e., anti-image correlations diagonals < 0.50). Sixty-five items were retained to form the short-form of the behavior scale (SLB-SF-65) which were subjected to a large-scale validation study involving 4,486 Hong Kong undergraduates.

^aItem SLB-13, the only sufficiently-loaded (loading $\geq |0.40|$) item on Component 13, was removed together with the component. ^bAs component 13 only contained one item and was subsequently removed from the final solution, the total variance was computed by the summation of variance explained by the remaining twelve components. SLB-LF-97: 97-item Service Leadership Behavior Scale- Long-Form; SLB-SF-65: 12-factor, 65-item version of SLB-SF-65. S1: Subscale 1 (6 items, *Problem-Solving*); S2: Subscale 2 (9 items, *Self-leadership and Life-long Learning*); S3: Subscale 3 (10 items, *Non-cognitive Intrapersonal Competences*); S4: Subscale 4 (5 items, *Distributed Leadership*); S5: Subscale 5 (6 items, *Integrity*); S6: Subscale 6 (7 items, *Caring Behavior*); S7: Subscale 7 (3 items, *Compassion*); S8: Subscale 8 (4 items, *Self-reflection*); S9: Subscale 9 (4 items, *Service Provision*); S10: Subscale 10 (3 items, *Positive Social Relationship*); S11: Subscale 11 (4 items, *Communication Skills*); S12: Subscale 12 (4 items, *Fairness*). All correlation coefficients are statistically significant at $p < .001$ (two-tailed).

Furthermore, as the SLAM framework is catered to service economies which are characterized by *distributed leadership* and *decentralization* rather than *absolute control* and *centralization* [38], we expected a positive correlation between the behavior scale with the *Systemic Thinking Scale* (i.e., Hypothesis 5) while a negative association with the *Hierarchical Thinking Scale* (i.e., Hypothesis 6). Finally, while paternalistic leadership is characterized by a strong sense of hierarchy which contradicts the SLAM framework [7, 38], it also emphasizes leaders' exhibition of benevolence and integrity which correspond to the fundamentals of Service Leadership education [39]. As a result, a positive while mild correlation between the behavior scale (and the subscales) and the *Paternalistic Leadership Scale* (PTL) was predicted (i.e., Hypothesis 7).

OUR FINDINGS

Results of the MAP showed that the squared average partial correlation was at a minimum (0.00821) upon the extraction of the thirteenth factor, suggesting that thirteen factors should be retained [40]. Item 89 was deleted due to its poor (i.e., anti-image correlations diagonals below 0.50) individual measure of sampling adequacy [19]. Accordingly, the PAA was re-administered on the remaining 96 items specifying the extraction of thirteen factors. Each item's factor loadings, eigenvalues, the percentage of variance explained by each factor, and the correlations amongst the different factors are presented in table 3.

Applying the two exclusion criteria as abovementioned, nine double-loaded items were first eliminated. This was followed by the removal of 21 insufficiently-loaded items. Item 13, the only item loaded sufficiently on the thirteenth factor (see Table 3), was deleted as well. Ultimately, the resultant 65-item, twelve-factor solution—which accounted for 57.97% of the total variance—formed the short-form of the Service Leadership Behavior Scale (SLB-SF-65). The twelve factors, each of which forms a subscale, were accordingly named “Problem-Solving” (items 5 to 10), “Self-leadership and Life-long Learning” (items 72 to 76, 81 to 84), “Non-cognitive Intrapersonal Competences” (items 12, 14, 16 to 23), “Distributed Leadership” (items 86, 87, 91, 92, 95), “Integrity” (items 29, 43 to 46, 57), “Caring Behavior” (items 66, 67, 69 to 71, 85, 93), “Compassion” (items 52, 61, 62), “Self-reflection” (items 77 to 80), “Service Provision” (items 1 to 3, 53), “Positive Social Relationship” (items 26 to 28), “Communication Skills” (items 34, 39 to 41), and “Fairness” (items 47 to 50).

Reliability of the Total Scale and Subscales

As detailed in Table 4, both long-form (SLB-LF-97) and short-form (SLB-SF-65) of the behavior scale showed excellent internal consistency (all α values $\geq .95$, mean inter-item correlations $> .20$) in the whole sample ($N = 214$) and across two subsamples split based on participants' gender. All subscales, except for the three-item subscale “Compassion”, demonstrated at least acceptable internal consistency (all α values $\geq .70$, mean inter-item correlations $> .30$).

Table 4. Internal consistencies of SLB-LF-97, SLB-SF-65, and subscales across gender

	Whole Sample (N = 214)		Males (N = 60)		Females (N = 154)

Subscale 8: <i>Self-reflection</i>	0.88	0.65	0.91	0.73	0.87	0.62
Subscale 9: <i>Service Provision</i>	0.73	0.40	0.70	0.36	0.73	0.41
Subscale 10: <i>Positive Social Relationship</i>	0.85	0.65	0.88	0.70	0.83	0.61
Subscale 11: <i>Communication Skills</i>	0.81	0.52	0.86	0.61	0.78	0.47
Subscale 12: <i>Fairness</i>	0.86	0.61	0.88	0.64	0.85	0.59

Note. α = Cronbach's alpha value.

Despite the seemingly unacceptable alpha values (i.e., 0.59 to 0.61), inspection of the range of mean inter-item correlations of subscale "Compassion" (i.e., 0.34 to 0.37) revealed that they all fell within the range (i.e., 0.20 to 0.40) of "optimal level of homogeneity" (p. 114) defined by Briggs and Cheek [41]. In short, the present findings provided support for the high reliability of the different forms of the behavior scale and its subscales.

Validity Assessment: Correlation with External Criterion Measures

Confirming Hypotheses 1 to 4, correlational findings (see Table 5) revealed a significant ($p < .05$, two-tailed), positive correlation between the SLB-SF-65 (and almost all the subscales) and the *Revised Servant Leadership Profile*, *Interpersonal Reactivity Index* (including the composite score and the two subscales), *Moral Self-Concept*, and *Leadership Efficacy*, respectively. Hypothesis 5 was also supported as the *Systemic Thinking Scale* (ST) was significantly and positively associated with the SLB-SF-65 alongside its subscales (see Table 5). Echoing Hypothesis 7, despite the statistical significance ($p < .05$, two-tailed), the SLB-SF-65 was only mildly correlated ($r = 0.25$) to the *Paternalistic Leadership Scale* (PTL). Similar findings (see Table 5) emerged when the subscales were correlated with PTL (r s ranging from 0.04 to 0.25), further supporting Hypothesis 7.

Meanwhile, contrary to Hypothesis 6, both SLB-SF-65 and the subscales were positively correlated to the *Hierarchical Thinking Scale* (see Table 5). This may be attributable to the non-mutual exclusiveness of *Hierarchical* (HT) and *Systemic Thinking* (ST) whereby people can be both hierarchical and systemic thinkers [17]. Hence, it is possible that the present positive link between HT and SLB-SF-65 ($r = 0.30$) was due to the moderate correlation between ST and SLB-SF-65 ($r = 0.51$) and that of HT and ST ($r = 0.44$). Indeed, once ST was

controlled for, the HT-SLB-SF-65 correlation was no longer significant ($p = .17$, two-tailed). In contrast, the ST-SLB-SF-65 link ($r = 0.44$) remained to be moderate even after controlling for HT. In short, while these results seemingly contradicted Hypothesis 6, further scrutiny revealed a pattern of findings that resonated with Wielkiewicz's [17] conceptualization of HT and ST.

9. LEF	0.84 (0.41)	0.553***	—	—	—	—	—	—	—	—

Note. N= 214. *** $p < .001$ (two-tailed), RSLP: Revised Servant Leadership Profile; PTL: Paternal Leadership; IRI: Interpersonal Reactivity Index; IRI-EC: Subscale "Empathic Concern"; IRI: PT: Subscale "Perspective Taking"; MSC: Moral Self-Concept; HT: Hierarchical Thinking; ST: Systematic Thinking; LEF: Leadership Efficacy. Unless otherwise specified by the superscript "n.s." which denotes statistical non-significance, all other Z-scores of difference were significant at $p < .05$ (two-tailed) (i.e., $|Z\text{-score}| > 1.96$).

Furthermore, utilizing the statistical package *cocor* [42] which allows the comparison of strengths between two pairs of correlation coefficients using Steiger's [43] z-test, the results (see Table 6) highlighted that out of all significant associations, the SLB-SF-65 was most strongly correlated to the *Revised Servant Leadership Profile* ($r = 0.78$) while considerably more weakly associated with the *Paternalistic Leadership Scale* ($r = 0.25$) as well as the *Hierarchical Thinking Scale* ($r = 0.30$). Taken together, these findings are generally supportive of the convergent validity of the SLB-SF-65—which was shown to consistently correlate with various constructs theorized to underscore the behavioral qualities characteristic of an elite Service Leader.

DISCUSSION

Utilizing a sample of 231 PolyU students, the present study attempted to examine the internal consistency, factorial validity, and convergent validity of the 97-item long-form of the Service Leadership Behavior Scale (SLB-LF-97). Moreover, findings of the EFA suggested the retention of 65 items which formed the short-form of the behavior scale (SLB-SF-65). Besides recording meritorious internal consistency, the SLB-SF-65 and the subscales were shown to correlate significantly and positively with all the external criterion measures. Specifically, by confirming six out of seven hypotheses (i.e., Hypotheses 1 to 5 and 7), the present correlational findings underscored the convergent validity of the SLB-SF-65. In short, the present results not only vouch for the psychometric property of the 65-item SLB-SF-65, but also its utility in serving as a sound measurement tool to help evaluate whether an individual has exhibited adequate behavioral qualities representative of a genuine Service Leader.

There are several key contributions of this work. First, amidst the scanty evidence base of assessment inventory about leadership especially in the Chinese context [8, 12], the SLB-SF-65 constitutes a timely addition to the literature. As remarked by Ho and Nesbit [44], the interdependent construal of interpersonal relationships unique to a collectivist society such as China could constitute a fundamentally different interpretation of leadership. Hence, it is imperative that objective measurement tool be tailor-made for the Chinese population, especially considering that China accounts for about 20% of the global population. Second, the present paper informs the literature of Service Leadership education. Considering the paucity in robust evaluation methodologies as regards leadership training programs [13], the SLB-SF-65 would be useful for implementers attempting to gauge the effectiveness of a Service Leadership training program. A successful training should, in principle, enhance trainees' propensity to display behavioral qualities representative of a true Service Leader which can be operationalized by a post-program improvement in one's SLB-SF-65 score. Third, as a precursor to a validation study involving 4,486 Hong Kong undergraduates (i.e., the main event of "The Project"), the present findings justify the inclusion of the 65-item SLB-SF-65 by underscoring its excellent internal consistency and strong convergent validity. Moreover, the preliminary item-screening and eventual trimming of the scale did not only add to the ease of administration, but also facilitate the elicitation of quality responses which are crucial to the ensuing large-scale validation study.

Nonetheless, there are certain issues worthy of our attention. One glaring concern would be the legitimacy of the present EFA attributable to the sample size of the present study ($N=214$). As the present subjects-to-variables (i.e., STV) ratio only amounts to 2.23, which is below the commonly adopted “rule-of-thumb” STV ratio of 5 [see 45] for a list of “rule-of-thumb” STV ratios), there is inevitably a concern of under-sampling. However, previous research [e.g., 46, 47] had staunchly challenged the validity and utility of those “rules of thumbs”, as these researchers maintained that sampling adequacy should also depend on other factors such as communalities and size of loadings. Particularly, MacCallum and colleagues [45] specified that good recovery of population factors can be achieved “with communalities in the range of 0.5” (p. 96) and “a somewhat larger sample in the range of 100 to 200” (p. 96). Given that both these criteria were met in the present analysis (i.e., $N=214$; average communality = 0.53), there is no reason to outright dismiss the meaningfulness of the present EFA findings just because of the low STV ratio. Of course, there is a need to further assess the stability of the factors extracted because it is easy for multivariate statistics to capitalize on chance.

Additionally, owing to the exploratory nature of the present dimensionality assessment, there is a need to conduct a confirmatory factor analysis (CFA) to further examine the absolute and relative model fit of the current twelve-factor solution to participants’ responses [20]. Nevertheless, due to the sample size concern as outlined above, conducting a CFA by further splitting the present sample into two halves is just not workable. Therefore, to better ascertain the stability and fit indices of the current twelve-factor solution, both EFA and CFA need to be administered in the ensuing large-scale validation study ($N=4,486$) as mentioned above.

Furthermore, contrary to Hypothesis 6, the SLB-SF-65 was positively correlated to the *Hierarchical Thinking Scale* measuring people’s orientation toward leadership as a “leader-centric” concept whereby leaders ought to take the lion’s share of blames or credits for the organizational outcomes [17, 48]. As abovementioned, the non-mutual exclusiveness of Hierarchical (HT) and Systemic Thinking (ST) [17], coupled with the present positive, moderate correlation between the two and that between ST and SLB-SF-65, may account for the present positive association between HT and SLB-SF-65. Indeed, Wielkiewicz and colleagues [48] contended that an elite leader should in theory “embrace these two forms of leadership (beliefs)” (p. 4) owing to their more sophisticated understanding on and experience with leadership. Taken together, it is conceivable that the positive link between HT and SLB-SF-65 was attributable to those “elite leaders” in the present sample who scored high on both HT and ST. Findings from the partial correlation analyses implied just that. As ST was controlled for, the positive HT-SLB-SF-65 association became non-existent, while the ST-SLB-SF-65 link remained highly significant and moderate even after controlling for HT. Nevertheless, the question why is Service Leadership behavior insignificantly, instead of negatively, linked to Hierarchical Thinking remains an interesting research topic to be examined in future.

Notwithstanding the above concerns, the present paper constitutes a pioneer assessment on the convergent and factorial validity of the Service Leadership Behavior Scale. Not only did the current findings strongly corroborate the psychometric soundness of the SLB-LF-97, they also provided a glimpse into an interpretable factorial structure of SLB-LF-97 which warrants further empirical scrutiny. More importantly, as the precursor to the main event of “The Project”, the current study serves a preliminary screening purpose which informs the list

of scale items worthy of inclusion in the upcoming large-scale validation study. Last but not least, the current paper helps to bridge a well-documented literature gap in the systematic evaluation of Service Leadership education [8, 13] by introducing a valid and reliable tool to measure people's behavioral qualities as a good Service Leader.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

In this chapter we report the development of the 97-item Service Leadership Behavior Scale (i.e., SLB-LF-97) based on the Service Leadership framework proposed by Po Chung. To understand the content validity of the scale, the content validity of the developed items was examined. A panel of experts (n = 3) was formed to assess the content validity of the scale items in different domains (service provision, competence, character, caring, commitment to continuous improvement, and distributed leadership) in terms of relevance, clarity, and representativeness on each item. Results indicated that the SLB-LF-97 has an excellent content validity indexed by relevance, clarity, and representativeness for the whole scale and the different categories. The findings suggest the scale and subscales of the Service Leadership Behavior Scale possess excellent content validity.

INTRODUCTION

Desirable leadership characteristics vary with the characteristics of different economic systems. The leadership qualities required by service economy are different from those required by manufacturing economy. Generally speaking, leadership in the manufacturing economy was regarded as inflexible, task-focused, and authority-based. In contrast, effective leadership in the service economy is characterized by people orientation, relationship orientation and service orientation [1]. Hong Kong has a service-oriented economy where the service industries shared 92.2% of the Gross Domestic Product (GDP) in 2016 [2]. With respect to the growth of service economy in the global context, Chung [3] proposed the notion of service leadership and developed the Service Leadership and Management Model (SLAM). As defined by Chung [3], service leadership “is about satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments”. It is also believed that effective service leadership is a function of leadership competencies, character, and caring disposition [4].

Although the notion of service leadership is newly proposed, its related components are not brand-new. Compared with other mainstream leadership theories and approaches, service leadership shares some similar features, such as the emphasis on integrity [5]. Nevertheless, the service leadership model has its distinctive features that are seldom mentioned in other theories. To begin with, not a single leadership theory emphasizes the importance of the service orientation, including servant leadership theory [6], authentic leadership theory [7], and ethical leadership theory [8]. Besides, these theories primarily conceptualize leadership at the individual level, dealing with the leadership behaviors of self and/or others. For example, while authentic leadership is mostly dependent on leaders’ behaviors in self-reflection, self-management, and self-improvement [7], service leadership theory adopts a more systematic multi-level perspective towards the service for self, others, as well as the ecological system [4].

Besides, some leadership theories argue that excellent leadership primarily relies on the competencies or certain personal qualities of the leaders. For example, managerial competencies are the core elements for top-down leadership theory [9], while a set of born characteristics is proposed to determine the success of a leader according to the trait approach to leadership [10]. In contrast, the service leadership framework asserts that competencies and character are not enough for an effective leader in the modern service economy [3]. The SLAM framework suggests three components that determine effective leadership, including moral character, leadership competencies, and caring disposition (for short, $E = MC^2$). This framework not only highlights the importance of service leaders’ personal qualities and competencies but also establishes a more comprehensive and systematic model to explain how these characteristics contribute to effective leadership [5].

Furthermore, although both service leadership and servant leadership focus on the development of followers through mentoring and teaching [11], servant leaders only focus on the followers rather than the leaders. Moreover, service leadership considers that everyone could be a leader and leadership requires life-long continuous improvement. Lastly, another new feature that service leadership goes beyond the other existing theories is that the SLAM framework incorporates Chinese cultural values and the philosophies of Buddhism,

Confucianism, and Taoism [3]. The incorporation helps to look at moral character from an integrated perspective. Overall speaking, service leadership theory is multidisciplinary in nature that it covers leadership in different domains [12].

As university students are the future leaders in society, service leadership education is essential for youths [13]. With the collaborative partnership of the Victor and William Fung Foundation, the Hong Kong Institute of Service Leadership & Management Limited (HKI-SLAM), and the eight universities funded by the University Grants Committee in Hong Kong, the Fung Service Leadership Initiative (SLI) was initiated in 2012 to promote service leadership education. The Hong Kong Polytechnic University (PolyU), among the eight universities, has developed and provided credit-bearing courses and non-credit-bearing programs/workshops on service leadership within the SLAM curriculum framework [14]. Both qualitative and quantitative evaluation strategies have supported the positive influences on the leadership capacities of students who have participated in the courses or programs [15-17]. In general, the service leadership education has obtained great achievement and recognition among university students.

Although some initiatives on service leadership education have been launched, there is little empirical research that assesses the qualities of service leaders. A survey of the literature shows that leadership behavior scales based on different leadership theories have been used, such as the Multifactor Leadership Questionnaire (MLQ) [18] that allows individuals to measure their own transformational, transactional, and passive-avoidant leadership behaviors. However, the MLQ has been criticized by researchers for having problematic construct validity issues as it focuses primarily on transformational leadership, rather than the other two leadership styles [19]. Other specific leadership behavior scales were largely developed with respect to its corresponding leadership theory, which has different conceptualizations from the Service Leadership theory. For example, the Transformational Leadership Inventory [20], the Authentic Leadership Inventory (ALI) [21], and the Servant Leadership Behavior Scale [22] were developed according to corresponding leadership theories. Therefore, there is an urgent need to develop a measurement specifically for the Service Leadership theory.

To fill this gap and to strengthen the assessment component of service leadership education, the Research Team at The Hong Kong Polytechnic University (PolyU) embarked on a research project entitled “Development and Validation of Measures Based on the Service Leadership Model”. In this project, three scales on service leadership (knowledge, attitude, and behavior) were developed and validated. Previous studies have documented the processes of developing the Service Leadership Attitude Scale and Knowledge Scale [23, 24]. Results of both studies showed that the items developed were perceived to be relevant, clear, and representative of the constructs of service leadership attitude and knowledge. In this paper, we reported the development of the 97-item Service Leadership Behavior Scale (SLB-LF-97) and its related content validation findings.

Generally speaking, three steps were involved in developing an assessment tool, including domain identification, item generation, and instrument formation [25]. For the present study, the SLB-LF-97 was developed based on the groundwork of the HKI-SLAM curriculum framework [3], 7 core beliefs of service leadership [26], 12 dimensions of the personal quality of service leadership [5], 25 principles of service leaders [4], and the existing literature. Specifically, the developed scale attempted to cover the behavior of service leaders in the following key domains:

1. **Service provision** – According to the Service Leadership theory, it is essential for service leaders to satisfy the needs of self, others, and systems, which is elaborated in the Core Belief 1 of the SLAM framework [26]. Also, as advocated by The Principle of Service Mindset [1], service leaders must have genuine care for others' needs. However, unlike servant leadership theory or spiritual leadership theory which overemphasizes followers' needs and neglects leaders' needs [5], service leadership theory adopts a more balanced approach in looking at the needs of the followers and leaders.
2. **Competence** – The traditional leadership approaches emphasize management skills or expertise [9], which is more applicable to the manufacturing economy. In contrast, leadership competency in the service economy has a broader coverage focusing on the importance of intrapersonal and interpersonal competencies [3]. Four types of intrapersonal competencies are concerned the most in the service leadership education [27]. First, intelligence quotient (IQ) is closely related to job performance as well as leadership performance [28]. The IQ of an effective service leader is manifested in good problem-solving, critical thinking, logical reasoning, and analytical abilities [27]. The second intrapersonal competence is emotional quotient (EQ), which is one of the most recognized non-intellectual factors that contribute to our work and daily life [29]. The ability to understand, recognize, and manage emotions of oneself and others will undoubtedly enhance the performance and leadership at work [30]. The other two essential intrapersonal competencies for service leaders are adversity quotient (AQ) and spiritual quotient (SQ). AQ addresses the ability to accept and successfully bounce back from failure, misfortune, or other adversity situations [31], while SQ is regarded as the ability to use meaning, faith, and other spiritual resources to solve problems [32]. A competent service leader possesses and utilizes intrapersonal competencies to serve oneself, others, and systems.

In addition, interpersonal competencies are also among the core personal attributes that service leaders should promote [33]. Five task domains of interpersonal competence were identified by Buhrmester, Furman, Wittenberg, and Reis [34], which included initiating relationships, self-disclosure, emotional support, conflict managing, and asserting personal thoughts and feelings. Besides, the SLB-LF-97 incorporates Chinese philosophy to enrich the model. As such, six components of interpersonal competencies are considered in the SLB-LF-97: passionate about people; positive social relationships; assertiveness; collaboration and cooperation with people; conflict resolution; and communication skills. Specifically, service leaders are supposed to be people-oriented (*"yi ren wei ben"*) and develop positive and healthy relationships with others. Meanwhile, an effective service leader shows great verbal and non-verbal communication skills, through which one could develop and maintain collaborative relationships with teammates and other people, as well as assert one's own rights when having conflicts. In short, service leaders with good interpersonal competencies can appreciate different opinions (*"he er bu tong"*) and create constructive ways to resolve interpersonal conflicts.

3. **Character** – Complying with the Principle of Competence, Character, and Care [4], and the Principle of Personal Ethics [4], leaders in the service economy are required to exhibit positive characters that are morally valued, which make followers more

willing to work with them [35]. In Western cultures, Park, Peterson, and Seligman [36] developed the VIA Classification and listed 24 virtues in action, such as integrity, gratitude, forgiveness, and bravery. However, Eastern cultural philosophies, particularly, Confucianism also uphold some traditional character strengths, such as benevolence (“*ren*”), affection (“*ai*”), and forgiveness (“*shu*”) [37]. The SLB-LF-97 synthesizes the Eastern and Western cultures and highlights the service leadership virtues by integrity, fairness, humility, and acting as an ethical role model.

4. **Caring** – This category covers the quality of caring disposition of the service leaders. The Principle of Trust, Fairness, Respect, and Care implies that successful service experiences cannot exist without caring service leaders [4]. A competent and moral service leader should also show concern for others and oneself [38]. Two aspects of caring disposition are measured in the SLB-LF-97. On the one hand, good service leadership involves the qualities of concern, such as empathy and compassion. On the other hand, caring leaders provide care for others by loving, supporting, and developing others.
5. **Commitment to continuous improvement** – The need for continuous improvement is one of the key characteristics of the service leadership model [5]. The HK-SLAM model emphasizes self-leadership and growth mindset, rather than the notion of “inborn” or “elite” leadership [26]. Besides, only through continuous professional and personal improvement could one be well prepared to serve oneself as well as others. Therefore, effective service leaders should make efforts to promote self-leadership, self-reflection, and life-long learning.
6. **Distributed leadership** – In response to the core belief of service leadership that “every day, every human occupies a position of leadership and possesses the potential to improve his leadership quality and effectiveness” (Core Belief 2) [26], distributed leadership style in the service economy encourages and empowers every teammate to voice out and contribute their insights to the team decision-making. Meanwhile, distributed leaders would show trust and respect to followers by acknowledging and respecting their views and abilities.

A well-developed Service Leadership Behavior Scale is indispensable for educators and researchers to empirically investigate students’ changes after taking service leadership education. Such a scale serves as an instrument for assessing one’s qualities of service leadership, which enables researchers to further validate the theory and hypotheses proposed by the service leadership model, such as the principle $E = MC^2$. Based on the Service Leadership model, the PolyU Research Team drafted a total of 97 items for the Service Leadership Behavior Scale. However, before formally utilizing the scale and interpreting scores with confidence, the validation process is a highly critical step in the test development [39]. To obtain judgmental evidence on whether the scale and items could adequately represent the content of service leadership behavior, content validation procedure was conducted in the present study.

Content validation was defined as “the degree to which elements of an assessment instrument are relevant to and representative of the targeted construct for a particular assessment purpose” [40, p.238], or “whether or not the items sampled for inclusion on the tool adequately represent the domain of content addressed by the instrument” [41, p.155].

One of the most frequently utilized approaches for content validation in previous research is the engagement of “content experts” [42], in which several knowledgeable people in a specialized area discuss and have consensus on the quality and representativeness of the instrument items. To minimize errors arising from subjective assessment and artificial consensus [43], content validity index (CVI) [44] was employed in the current study, which provides quantitative judgment evidence for the content validity of the test, including relevance, clarity, and representativeness [44]. In the present study, a panel of experts was invited to evaluate the items of the SLB-LF-97. Based on the quantitative and qualitative content validation findings, revisions were made to improve the scale.

OUR STUDY

The present study documented the development of the SLB-LF-97 and evaluated its content validation. Based on a thorough examination of the tenets of the Service Leadership Model [3] and leadership literature (e.g., spiritual quotient, [32]), an item pool on the behaviors and qualities of service leaders was established. The following six categories are included in the SLB-LF-97:

- C1. Service provision** (4 items). Items in this category assess respondents’ tendency of having a sensitivity to individuals’ needs and providing good service to others.
- C2. Competence** (38 items). This category addresses behaviors and qualities representing intrapersonal and interpersonal competencies within the framework of HKI-SLAM [27, 33]. For the intrapersonal competencies, items measure individuals’ IQ, EQ, AQ, and SQ. For the interpersonal competencies, items assess “passionate about people”, “positive social relationship”, “assertiveness”, “collaboration and cooperation with people”, “conflict resolution”, and “communication skills”. Basically, intrapersonal and interpersonal competencies are covered under this domain.
- C3. Character** (14 items). Items in this category measure a well-developed personal code of ethics as characterized by integrity, fairness, humanity, and whether a person is acting as an ethical role model.
- C4. Caring** (15 items). This category underlines caring disposition defined by the Service Leadership Model [3], including notions that deeply embedded in Chinese virtues, such as items assessing “guan xin” (concern) and “zhao gu” (providing care).
- C5. Commitment to continuous improvement** (13 items). This category involves the notion that effective service leaders put self-development efforts aiming at ethically improving their competencies, abilities, willingness, and resources to satisfy the needs of others. Based on the 25 principles of service leadership [4], items evaluating individuals’ self-leadership, self-reflection, and life-long learning were constructed.
- C6. Distributed leadership** (13 items). Items in this category assess the three core characteristics of distributed service leadership, including shared decision-making, empowerment of teammates, and trust and respect.

Three experts familiar with the Service Leadership literature were invited to assess the extent to which the SLB-LF-97 measured what it was intended to measure. All experts had a doctoral degree and were involved in the curriculum development and/or the teaching of the subject “Service Leadership” and they have professional knowledge in Service Leadership, especially the framework of the HKI-SLAM.

Instrument

A self-administered questionnaire was distributed to the three experts. They evaluated the content validity for each item in the following aspects:

- 1) **Relevance**, the extent to which the item falls within the body of knowledge of the SLAM framework. Experts were asked to judge on a 4-point rating scale: 1 = *Irrelevant*, 2 = *Unable to assess the relevance without item revision or item is in need of revision or otherwise would no longer be relevant*, 3 = *Relevant but needs minor amendment*, 4 = *Relevant*.
- 2) **Clarity**, the extent to which the item is concise, accurate, and direct. Experts were asked to judge on a 4-point rating scale: 1 = *Very unclear*, 2 = *Unclear*, 3 = *Clear*, 4 = *Very clear*.
- 3) **Representativeness**, the extent to which the item adequately represents and encompasses the corresponding concept. Experts were asked to judge on a 4-point rating scale: 1 = *Very unrepresentative*, 2 = *Unrepresentative*, 3 = *Representative*, 4 = *Very representative*.

Meanwhile, the experts were requested to give justifications or suggested modifications if they had negative ratings (option 1 or 2) on the items. After rating the individual items, the experts were also invited to judge the overall quality of the scale via the following questions:

- 1) Does this batch of items cover all the essential behaviors of qualities within the service leadership framework?
- 2) Is there any additional behavior(s) or qualities that you regard essential to service leader? If yes, please list the additional point(s) below.
- 3) Does this batch of items adequately represent the behavior(s) or qualities in service leadership?
- 4) Any other comments (open-ended question).

Experts’ ratings were used to analyze the content validity of the scale, while their written feedbacks and suggestions would direct further revisions of the developed items.

FINDINGS

With reference to the previous studies, the I-CVI index for each item was computed as the number of experts giving a rating of 3 or 4, divided by the number of experts [i.e., 3] —

that is, the proportion in agreement about relevance, clarity, or representativeness. Then, the S-CVI/ave for each category was an average score of the I-CVIs for all the items. As shown in Table 1, most of the items indicated good I-CVIs. Items that with an I-CVI value lower than 1.00 were modified according to the experts’ comments. For example, the original item 24 “I have passion for people” was revised to “I show passion for other people’s welfare” because one rater considered that the original expression was too subjective and abstract. For the whole scale, the S-CVI/ave manifested excellent content validity (see Table 1). For each category, the S-CVI/aves for all subscales were also very good (see Table 2).

Table 1. The frequency of I-CVI and the S-CVI/ave for the whole scale

I-CVI	Relevance	Number of items (percentage)	
		Clarity	Representativeness
0.33	0 (0%)	1 (1.0%)	0 (0%)
0.67	5 (5.2%)	10 (10.3%)	3 (3.1%)
1.00	92 (94.8%)	86 (88.7%)	94 (96.9%)
S-CVI/ave	.98	.96	.99

Table 2. The S-CVI/ave for the subscales

No.	Domains	No. of items	S-CVI/ave		
			Relevance	Clarity	Representativeness
	Service provision	4	1.00	1.00	1.00
	Competence	38	.98	.91	.99
	Character	14	.93	.98	.95
	Caring	15	1.00	.98	1.00
	Commitment to continuous improvement	13	1.00	1.00	1.00
	Distributed leadership	13	1.00	1.00	1.00

DISCUSSION

The primary purpose of the present study was to develop the SLB-LF-97 as well as to ensure the measure is relevant to the framework, appropriate and clear, and could represent the concept of service leadership. The construction and validation of a Service Leadership Behavior Scale could help educators and researchers to assess the behaviors and related qualities in an effective service leader as outlined by the HK-SLAM framework [3] in a valid manner. The content validity index (CVI) method based on expert ratings has been widely used to quantify content validity [44]. In the Hong Kong context, researchers also have used this approach to develop and validate scales [e.g., 45, 46]. Both item-level content validity index (I-CVI) and average scale-level content validity index (S-CVI/ave) were calculated in the present study.

Results showed favorable results based on the views of three experts. First, all experts agreed that almost all items were relevant to the HK-SLAM framework and only 5 items needed minor revisions. Second, one item was rated as unclear, ten items were regarded as in need of revision, and the rest 86 items were rated as clear by all three experts. Third, all but 3 items were judged as representative of the framework by all the three raters. Based on the judges’ suggestions, scale developers have carried out revisions of the wording. Therefore,

according to the three experts' judgments, the developed items for the SLB-LF-97 could successfully measure what it was intended to measure. Some sample items for each category are presented in the Appendix.

Theoretically, the development of Service Leadership Behavior Scale is valuable for the leadership literature. A sound understanding of leader behavior and leadership effectiveness can hardly be achieved without research findings based on rigorous assessments. Thus, well-established instruments would help further validate the theoretical propositions and hypotheses of the service leadership model. Although past research has yielded a number of measurements on leader behavior, such as Servant Leadership Behavior Scale [22] and Leader Behavior Description Questionnaire (LBDQ) [47], there is a need to develop new Service Leadership measures because it is a new type of leadership theory. The present study helped with an initial check on the content validity of Service Leadership Behavior Scale and also highlighted the criteria of effective service leadership behaviors.

Practically, a validated measurement is indispensable for effective service leadership education. Although the eight universities in Hong Kong were involved in the Fung Service leadership initiative, no systematic effort has been made to develop appropriate assessment tools to assess service leadership behavior. With the development of the Service Leadership Behavior Scale, the effectiveness of leadership education could then be examined. A simple evaluation strategy would be to collect both pretest and posttest data before and after the training program.

It is noteworthy that there are several limitations of the present study. First, although the involvement of three raters fulfills the minimum requirement of numbers of experts proposed by Lynn [48], future studies could invite more parties to help increase its generalizability, such as scholars from other universities, management professionals who have been trained with service leadership qualities, or students who excellently finished the study of service leadership courses [40]. Second, there is still a need for the continued refinement and validation of the scale. For example, psychometric properties of the scale including reliability and validity should be verified [49]. Furthermore, theoretical and empirical relationships among service leadership behavior, attitude, and knowledge should also be explored. This process could also provide support for the construct validity of the measures. Despite the abovementioned limitations, the present study contributes to our understanding of the service leadership qualities. It also provides another valid measurement to evaluate service leadership education programs [23, 24].

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

APPENDIX: SAMPLE ITEMS (WITH ADAPTATION) OF THE SERVICE LEADERSHIP BEHAVIOR SCALE (SLB-LF-97)

Categories	Sample items
C1. Service provision	I provide service to others according to their specific needs. Readiness to serve: A good leader serves others with a genuine heart.
C2. Competence	<i>IQ</i> : When there is any issue that is out of my expectation, I can quickly come up with a workable solution on the spot. <i>EQ</i> : I can manage my negative emotions well so that it will not negatively affect my work. <i>SQ</i> : I have faith to deal with challenges in my life. <i>AQ</i> : Adversity such as failure and setback usually makes me stronger rather than weaker. <i>Passionate about people</i> : I value the well-being of other people. <i>Positive social relationships</i> : I am able to create a positive rapport with other people. <i>Assertiveness</i> : I uphold my own principles and stand firm to reject tasks that I think inappropriate. <i>Collaboration and cooperation with people</i> : I am good at collaborating with other people. <i>Conflict resolution</i> : I negotiate with others when we have conflict. <i>Communication skills</i> : I am able to effectively convey my thoughts and ideas to others.
C3. Character	<i>Integrity</i> : I am honest with people. <i>Fairness</i> : I treat people around me equally without favoritism. <i>Humility</i> : I recognize my limitations. <i>Role model</i> : People regard me as a person with ethical behavior.
C4. Caring	<i>Concern</i> : I am able to feel what other people are experiencing. <i>Provide care</i> : I do good things for other people without expecting them to return the favor.
C5. Commitment to continuous improvement	<i>Self-leadership</i> : I constantly seek to improve my character. <i>Self-reflection</i> : I give time to closely examine my own thoughts and behavior. <i>Life-long learning</i> : I keep learning new skills.
C6. Distributed leadership	<i>Shared decision-making</i> : When making decisions, I welcome critiques from my teammates. <i>Empowerment of teammates</i> : I delegate my power and authority to my teammates to facilitate their work. <i>Trust and respect</i> : I trust my teammates to make good decisions.

ABSTRACT

Building on the previous work regarding the assessment tools developed based on the Service Leadership Education model, this chapter reports a large-scale validation study on the Service Leadership Knowledge Scale. A total of 4,486 Hong Kong undergraduates recruited from eight universities funded by the government were administered the Service Leadership Knowledge Scale (Short-Form) with 50 items (SLK-SF-50). After the initial internal consistency assessment, 40 items were retained to form

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

the trimmed version (SLK-SF-40). Confirmatory factor analysis provided support for the hypothesized one-factor structure of the SLK-SF-40 and correlation analyses showed that the scale score was significantly related to different theoretically relevant constructs. The findings demonstrated that the trimmed Service Leadership Knowledge Scale (SLK-SF-40) is an objective measure in gauging individuals' knowledge about Service Leadership.

INTRODUCTION

As a result of the structural shifts in the global economic makeup over the past few decades, Hong Kong has transitioned from a manufacturing-based economy to a service-oriented economy [1]. Not only is such a transition characterized by the *production* aspects such as variability of the production process and GDP compositions and share of employment [1], the *people* aspects such as leaders' and organizations' perceptions of human nature and knowledge or competencies needed to excel also constitute the defining attributes of this transformation [2]. Owing to the evolution from an *Industrial* to a *Service* Age mentality [3], Chung [4, 5] argued passionately for the need of undergraduates in Hong Kong to learn effective leadership in a service economy, which is key to their survival and personal development in today's ultra-competitive business environment.

Against such a backdrop, a large-scale project entitled the "Fung Service Leadership Education Initiative", financially supported by the Victor and William Fung foundation and with the collaborative effort of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM) and the University Grants Committee (UGC), was implemented in eight UGC-funded universities in Hong Kong. Po Chung, Chairman of HKI-SLAM, instigated the concept of Service Leadership education targeting Hong Kong's undergraduates (i.e., SLAM framework). Specifically, the SLAM framework maintains that effective Service Leadership is embodied by "a leader or service provider possessing relevant situational task *competencies* plus being judged by superiors, peers, and subordinates as possessing *character* and exhibiting *care*" [6, p. 354]. Accordingly, the principle "Effective leadership = Moral character * Competencies * Caring disposition", summarized by the equation $E = MC^2$, is highly emphasized within the SLAM framework [6].

As each university would devise her curriculum on the nurturance of effective leadership attributes (i.e., MC^2) [7], it is imperative that systematic evaluation research is conducted to gauge the effectiveness of these independently developed curricula [8]. Particularly, Shek and Lin [9] argued that it is important to assess students' knowledge, attitudes, and behavior to assess an educational program's effectiveness. To facilitate the evaluation of Service Leadership education across universities, the research team at The Hong Kong Polytechnic University (PolyU) developed the long-form Service Leadership Knowledge Scale (SLK-LF-200; 200 items) to measure students' mastery of the fundamental knowledge points on the SLAM framework [10]. The assessment tool includes 200 multiple-choice scale items in seven domains based on the SLAM framework and the relevant literature [10]. These seven domains include the i) general descriptions of Service Leadership, ii) three realms of Service Leadership, iii) the belief that "Everyone can be a leader", iv) the principle " $E = MC^2$ ", v) manufacturing versus service economy, vi) distinction of Service Leadership and other leadership theories, and vii) other knowledge points in SLAM framework.

Utilizing a posttest-only control design, Shek and Lin [9] attempted to examine the criterion-related validity of the SLK-LF-200 with an undergraduate sample. The experimental group consisted of 67 students who took a three-credit “Service Leadership” course at the PolyU, whereas the control group was composed of 94 conveniently recruited PolyU students who had never taken the course. Inspection of each item revealed that the former significantly outscored the latter on 63 items. A follow-up inspection of these 63 criterion-valid items, led by the first author of this chapter, resulted in a further removal of 13 items due to duplication or face validity concerns. Ultimately, 50 items were retained to form the short-form of the Service Leadership Knowledge Scale (SLK-SF-50).

While Shek and colleagues [9, 10] pioneered the criterion and content validation of the initial knowledge scale (i.e., SLK-LF-200), the dimensionality and convergent validity of the short form (i.e., SLK-SF-50) remain to be ascertained. Against such a background, utilizing the responses of 4,486 undergraduates in Hong Kong, this chapter is primarily concerned with the psychometric properties of the 50-item SLK-SF-50 based on a large sample of students. Despite the fact that seven dimensions were theorized to be subsumed under the original scale (SLK-LF-200), the removal of three-quarters of items suggests that a re-examination of the trimmed scale’s (i.e., SLK-SF-50) dimensionality is necessary. Considering that the knowledge scale operationalizes respondents’ understanding of Service Leadership as “knowledge points” they acquired, and that a composite score which denotes overall proficiency is computed [9, 10], there is an implicit assumption that the knowledge scale is indeed unidimensional as the items cohere around one latent “knowledge” dimension [11, 12]. Hence, the proposed factor structure of the scale is a one-factor structure of the SLK-SF-50.

Convergent validity, which can be derived from “correlations with measures purporting to measure related constructs” [13], is also crucial in scale development as it informs whether the instrument can adequately probe into the target construct [14]. Utilizing several validated measures of relevant constructs outlined in the SLAM framework [see 15], including i) *Servant Leadership*, ii) *moral self-concept*, iii) *leadership efficacy*, and iv) *empathy*, this study sought to establish the convergent validity of the SLK-SF-50 via examining its correlations with these external measures.

OUR STUDY

Altogether 4,486 undergraduates (mean age: 20.47 years; SD: 1.67) from eight UGC-funded institutions completed the Short-Form Service Leadership Scale (SLS) validation study via an online platform. There were 1,517 (33.8%) male and 2,969 (66.2%) female respondents. The majority were aged 20 to 24 years (68.4%), had neither taken any credit-bearing Service Leadership (SL) subjects (74.3%) nor participated in any non-credit-bearing SL events a priori (82.0%), had previous work experience (91.4%), and had formerly served in leadership positions (61.4%). Additionally, 77.1% sat the Hong Kong Diploma of Secondary Education Examination (HKDSE). Table 1 highlights the demographic information for the present sample.

Procedures

All participants were administered the SLS online survey via the mySurvey@PolyU electronic survey system in March 2017. Students were asked to complete the survey in a self-administered fashion. Each participating university had her version of the online survey because the additional information asked is not the same. While the scale items were identical throughout, there were items probing into the respondents' demographics (e.g., faculty or school) and contact information of the person-in-charge that were unique to each university. The research objectives and guidelines on how to complete the questionnaire were detailed in the invitation emails and on the survey webpage. It was reiterated to students that it would take 45 to 60 minutes to conscientiously complete the whole survey. Each participant was given a supermarket voucher by the end of the study valued at HK\$100 or US\$12.80. Students indicated their consent or refusal to participate at the opening page.

Table 1. Basic demographic information for the current working sample (N = 4,486)

Demographic variables		N= 4,486
Valid responses from eligible participants from:	The Hong Kong Polytechnic University (PolyU)	1,000 (22.3%)
	The Chinese University of Hong Kong (CUHK)	505 (11.3%)
	The Education University of Hong Kong (EdUHK)	500 (11.1%)
	Hong Kong Baptist University (HKBU)	517 (11.5%)
	City University of Hong Kong (CityU)	464 (10.3%)
	Lingnan University (LU)	500 (11.1%)
	The University of Hong Kong (HKU)	500 (11.1%)
	Hong Kong University of Science and Technology (HKUST)	500 (11.1%)
Gender	Male	1,517 (33.8%)
	Female	2,969 (66.2%)
Age Group	15 to 19 years	1,344 (30.0%)
	20 to 24 years	3,070 (68.4%)
	25 to 29 years	69 (1.5%)
	30 years or above	3 (0.1%)
Year commencing on one's undergraduate study	2016	1,533 (34.2%)
	2015	1,164 (25.9%)
	2014	897 (20.0%)
	2013	742 (16.5%)
	2012 or before	150 (3.3%)
Number of credit-bearing Service Leadership (SL) courses taken*	0	2,962 (74.3%)
	1	951 (23.9%)
	2	71 (1.8%)
	3	2 (0.1%)
Number of non-credit-bearing SL events participated	0	3,680 (82.0%)
	1	506 (11.3%)
	2	230 (5.1%)
	3	62 (1.4%)
	4 or more	8 (0.2%)
Other leadership training taken	Yes	1,955 (43.6%)
	No	2,531 (56.4%)
Previous work experience	With work experience	4,102 (91.4%)
	Without work experience	384 (8.6%)
Self-proclaimed knowledge of Service Leadership	No knowledge	916 (20.4%)
	Little knowledge	1,590 (35.4%)
	Some knowledge	1,774 (39.5%)
	A lot of knowledge	195 (4.3%)
	All the knowledge	11 (0.2%)

Demographic variables		N= 4,486
Leadership position ever taken	Yes	2,753 (61.4%)
	No	1,753 (38.6%)
Entrance Exam	Hong Kong Diploma of Secondary Education Examination (HKDSE)	3,484 (77.1%)
	Hong Kong Advanced Level Examination (HKALE)	71 (1.6%)
	National College Entrance Examination (NCEE) in mainland China	221 (4.9%)
	Associate Degree/Higher Diploma in Hong Kong	495 (11.0%)
	Others (e.g., GCE A-Levels, IB, etc.)	215 (4.8%)
Grade Point Average	Mean converted Grade Point Average out of 4.00 (SD)	2.89 (0.45)
Time of completion	Average time (in minutes) taken to complete the survey (SD)	69.98 (383.13)

Note. *EdUHK does not provide any credit-bearing SL modules for her students.

Table 2. Number of cases retained in the main analyses

Participating universities	“Completed” cases as per record in mySurvey	Declined	Multiple participations	Deleted due to ineligibility of participants	Cases retained for the main analyses
EdUHK	506	0	6	0	500
CityU	477	0	3	10	464
HKUST	514	1	12	1	500
CUHK	511	2	0	4	505

HKU	508	1	2	5	500
HKBU	522	2	0	3	517
PolyU	1008	0	4	4	1000
Total	4555	6	33	30	4486

Table 3. Three sample items of the SLK-SF-50

Items	Options	Model Answer
8. A manager under the service economy wants to hire someone. Based on the Service Leadership model, which of the following advice would you give him/her?	A. Hire for qualifications, train for character B. Hire for character, train for skills C. Hire for attitude, train for character D. Hire for efficiency, train for mindset	B
22. In the four options below, which one belongs to an attribute of intelligence quotient (IQ)?	A. Raw power B. Attractiveness C. Sexual orientation D. Problem-solving skills	D
37. Which of the following statements is inconsistent with the concept of “respect”?	A. Showing off one’s strength B. Accepting and appreciating differences C. Accepting and appreciating oneself D. Serving as a key element in nurturing authentic relationship	A

Note. All sample items were slightly re-phrased due to copyright concern.

Participants’ completed electronic responses were downloaded as an EXCEL file for a preliminary data cleaning process before being converted to an SPSS file and a DAT file for statistical analyses. Several procedures were involved regarding the 4,555 completed responses as recorded. First, six cases of which students refused to participate were removed. Thirty more cases were excluded due to ineligibility of participants. These included a) participants completing the wrong survey (i.e., University A’s students completed the survey designed for University B’s students), and b) participants revealing themselves to be

non-undergraduates (e.g., postgraduates) in those open-ended questions. Furthermore, thirty-three cases of multiple participations—as per inspection of participants' student ID—were excluded from the main analyses. Accordingly, 4,486 cases were retained for further analyses. Table 2 features a breakdown of the number of cases retained for the present sample.

Instruments

The current questionnaire comprised items of the short-forms of the Service Leadership scales, including that of i) the Service Leadership Attitude Scale (SLA-SF-73; 73 items), ii) the Service Leadership Behavior Scale (SLB-SF-65; 65 items), and iii) the Service Leadership Knowledge Scale (SLK-SF-50; 50 items). The present chapter is primarily concerned about the validation of the 50-item SLK-SF-50.

Developed based on the HKI-SLAM framework, twenty-five principles of Service Leadership [16], twelve dimensions of a Service Leader [3] and the relevant literature [e.g., 15], a 200-item Service Leadership Knowledge Scale (i.e., SLK-LF-200) was designed to “capture the essential knowledge points of Service Leadership model in the format of multiple-choice questions” [10]. Fifty items were ultimately retained to form the SLK-SF-50, following Shek and Lin's [9] criterion-validation study and a follow-up item screening. Table 3 features three sample items and the model answers. Participants' responses were coded based on accuracies. Each *correct* answer would earn the participants one point, whereas an *incorrect* answer entitles them to zero point. The scale items are in English.

Several well-validated inventories from the leadership and personality literature were also utilized, with the objective to establish the convergent validity of the SLA-SF-73, the SLB-SF-65, and the SLK-SF-50. These external criterion scales included the Revised Servant Leadership Profile (RSLP; 20 items), Leadership Efficacy Scale (LEF; 8 items), the Moral Self-Concept (MSC; 8 items), and the Interpersonal Reactivity Index (IRI; 14 items). A few forced-choice and open-ended items assessing students' background demographics were also included.

1. **Revised Servant Leadership Profile (RSLP):** Developed by Wong and Page [17], the RSLP measures *Servant Leadership* as a multidimensional construct. Twenty items from five factors relevant to the SLAM framework—namely, i) *Empowering and developing others* (five items), ii) *Serving others* (seven items), iii) *Open, participatory leadership* (two items), iv) *Inspiring leadership* (two items), and v) *Integrity and authenticity* (four items)—were adopted at present. Items were rated on a seven-point Likert scale, with a higher score indicating a greater alignment with a Servant Leader's mentality. Reliability analyses showed an excellent internal consistency of RSLP ($\alpha = 0.94$; mean inter-item correlations = 0.46).
2. **Leadership Efficacy Scale (LEF):** LEF was developed by Murphy [18] as a measure of one's perceived “generalized capability in the leadership role” [19, p. 270]. The LEF, which was utilized in the present study, entails eight items which are rated on a five-point Likert scale. Higher scores indicate one's perceived capability that he/she could lead effectively. Reliability analyses highlighted the acceptable

internal consistency of LEF on the present sample ($\alpha = 0.72$; mean inter-item correlations = 0.25).

3. **Moral Self-Concept (MSC):** As a subscale under the Chinese Adolescent Self-Esteem Scales developed and validated by Cheng [20], the eight-item MSC measures participants' self-evaluation on facets of i) *Conduct and virtues*, ii) *Self-control and discipline*, and iii) *Altruism*. A slightly modified, English-translated version of the MSC—which operates on a seven-point Likert scale—was adopted in the present study. A higher score reflects a greater perceived importance of *morality* to oneself, which is a fundamental attribute of effective Service Leadership according to the SLAM framework [21]. Reliability analyses revealed a high internal consistency among the items ($\alpha = 0.83$; mean inter-item correlations = 0.44).
4. **Interpersonal Reactivity Index (IRI):** Developed by Davis [22], the IRI constitutes the most widely adopted assessment tool of empathy. Not only was the IRI validated cross-culturally [e.g., 23, 24], some suggested that it was the sole 'published measure that allows a multi-dimensional assessment of empathy' [25, p. 620]. Two subscales of IRI, namely i) *Perspective Taking* (PT; seven items) and ii) *Empathic Concern* (EC; seven items), were adopted for the current study. Items were rated on a five-point Likert scale, with a higher score indicating a "higher level of empathy which is an essential quality of ethical leadership" [26, p. 44]. Component scores for subscales PT and EC were computed alongside a composite IRI score. Cronbach's alpha coefficients of the subscales PT, EC, and the composite IRI score were 0.58, 0.62, and 0.74, respectively.

Data Analysis Plan

SPSS Statistics version 24.0 (IBM) was used for the descriptive statistical analyses (i.e., demographics) and examination of internal consistency and construct validity. Owing to the dichotomous nature (i.e., *correct* versus *incorrect*) of the coded responses, assessment of the factorial structure of the SLK-SF-50 (i.e., Confirmatory factor analysis [CFA]) was conducted using Mplus version 6.12 [27].

We first inspected the reliability indices of the 50-item SLK-SF-50. A Kuder-Richardson 20 coefficient of 0.93 was observed, suggesting excellent reliability. Ten items with item-total correlations below 0.30 were excluded from the ensuing CFA. We then re-examined the reliability indices of the 40-item, trimmed SLK-SF-50 (i.e., SLK-SF-40 hereafter). Regarding CFA, the proposed one-factor structure was tested using the robust weighted least squares (WLSMV) estimator, which is appropriate for categorical items [28].

We examined the model fit using several indices including, a) Bentler-Bonett Nonnormed Fit Index (NNFI), b) comparative fit index (CFI), c) root mean square error of approximation (RMSEA; including also the 90% confidence interval [90% CI]), and d) weighted root-mean-square residual (WRMR). Based on the recommendations in the literature [29-31], a model with a NNFI exceeding 0.95, a CFI greater than 0.95, a RMSEA lower than 0.05 (with an upper CI value below 0.08), and a WRMR smaller than 0.90 would be considered an 'excellent' fit. Models with a 'good' fit should produce indices close to the above standards [28]. We also reported the STDY metric for each item, which denotes the change in standard

deviation units of outcomes (as per unit change in predictor). The STDY metric represents each item's standardized factor loading [32].

Lastly, the total scale score was correlated with the different criterion measures. Considering that the knowledge preached in the Service Leadership curriculum covers domains on *Servant Leadership*, *leadership efficacy*, *morality*, and *empathy*, we would predict a positive correlation between the SLK-SF-40 with each of these external criterion scales (and subscales). Correlational analyses with other Service Leadership scales (and subscales) under validation were also administered. Data of the entire sample ($N = 4,486$) were utilized throughout every step of the present validation study. Specifically, we hypothesized that the SLK-SF-40 would be positively and significantly correlated with i) RSLP, ii) LEF, iii) MSC, and iv) IRI (subscales EC and PT). We expected the SLK-SF-40 to also correlate positively with the validated versions of the SLA-SF-73 and SLB-SF-65 (and the subscales), considering that all these scales were constructed to assess the same underlying topic with different focuses (i.e., knowledge, attitude, and behavior).

FINDINGS

After removing ten items with low item-total correlations, reliability analyses revealed the excellent internal consistency of the 40 items retained ($\alpha = 0.94$, mean inter-item correlations = 0.28). All items had a corrected item-total correlation above 0.31.

Confirmatory Factor Analysis

Table 4 presents the model-fit indices of the proposed single-factor structure of SLK-SF-40, alongside the criteria for goodness-of-fit evaluation as abovementioned. Overall, the NNFI, CFI, and RMSEA all suggested that the present proposed one-factor structure fit excellently with the current data [29-31], while the WRMR exceeded the proposed cut-off of 0.90, suggesting a model misspecification [33]. Nevertheless, Newsom [34] cautioned against the sole reliance on WRMR as the only indicator of fit as it “does not always give sensible results (p. 3)”, and there is evidence [e.g., 35] that the three other metrics adopted at present (i.e., NNFI, CFI, and RMSEA) could perform well with categorical model estimations. Taken together, the examination of the goodness-of-fit indices offers preliminary support to the one-factor solution of SLK-SF-40.

We also scrutinized the individual parameter estimates of the present proposed one-factor solution. Table 5 presents every item's i) standardized factor loading (i.e., STDY estimates), ii) R-squared, iii) accuracy rate, iv) residual variance, and v) item-total correlations. As addressed in the table, the factor loadings and R-squared of all the SLK-SF-40 items were positive and significant at $p < .001$. The STDY estimates ranged from moderate to strong (0.32 to 0.90). No spurious findings were observed regarding the standard errors. These findings, in conjunction with the goodness-of-fit indices (see Table 4), again gave support to the proposed one-factor structure of the knowledge scale. Accordingly, this single-factor model was accepted as the final factorial solution, and each respondent's SLK-SF-40 score was computed via a simple summation of their *correct* responses to the 40 items.

Table 4. Model fit indices for the one-factor structure of SLK-SF-40

Model Tested	χ^2	Df	WRMR	NNFI	CFI	RMSEA (pclose)	RMSEA (90% C.I.)
One-factor	3,492.44	740	1.725	0.985	0.984	0.029 (1.00)	0.028/0.030
Criterion for goodness-of-fit	-	-	≤ 0.90	≥ 0.95	≥ 0.95	≤ 0.05	≤ 0.08

Note. WRMR= weighted root-mean-square residual; NNFI= Bentler-Bonett Nonnormed Fit Index; CFI= comparative fit index; RMSEA= root mean square error of approximation; pclose= probability of RMSEA ≤ 0.05 ; 90% CI= 90% Confidence Intervals (lower value/ upper value).

Table 5. Individual parameter estimates of the one-factor SLK-SF-40 (N= 4,486)

Note. * Each correct (incorrect) response was coded "1" ("0"). ** Accuracy Rate = (Number of correct responses)/ (Total responses, i.e., 4,486) *100%. All standardized factor loadings and R² metrics were statistically significant at $p < .001$ (two-tailed).

Validity Analyses: Correlation with External Criterion Scales (and Subscales)

Confirming our hypotheses, findings of the correlational analyses (see Table 6) indicated that the SLK-SF-40 scores correlated significantly (all $ps < .001$) and positively with all external criterion scales (and subscales). Utilizing the *cocor* statistical package [36] which allows comparisons of strengths of association across two pairs of correlation coefficients e.g., Steiger’s [37] computation of z-score using average correlations), the findings (see Table 6) indicated that amongst the significant associations, the SLK-SF-40 correlated most strongly with the *Interpersonal Reactivity Index* ($r = 0.438$, $N = 4,486$) and least with the *Leadership Efficacy* ($r = 0.125$, $N = 4,486$). These findings should give substance to the convergent validity of the SLK-SF-40 as it was demonstrated to relate positively and significantly to a myriad of well-validated measures (e.g., IRI and MSC) on constructs that were highly emphasized in the SLAM framework (e.g., empathy and morality).

Table 6. Correlations between SLK-SF-40 and the presently adopted external criterion scales

Validity Analyses: Correlation with Other Service Leadership Scales under Validation

As detailed in Table 7, the SLK-SF-40 correlated significantly (all $ps < .001$) and positively with both composite scores of the six-factor, 38-item Service Leadership Behavior (i.e., SLB-SF-38) scale ($r = 0.178$, $N = 4,486$) and the eight-factor, 46-item Service Leadership Attitude (i.e., SLA-SF-46) scale ($r = 0.337$, $N = 4,486$). Discussions regarding the validations of both SLB-SF-38 and SLA-SF-46 are featured in two other papers within the current issue. The SLK-SF-40 also correlated positively with almost all the subscales of SLB-SF-38 and SLA-SF-46. These findings are consistent with our hypotheses that the three concurrently administered Service Leadership scales are positively and significantly associated with one another.

Furthermore, comparison via the *cocor* package highlighted that the strengths of correlations between SLK-SF-40 and SLA-SF-46 (and the subscales) were overall significantly greater ($ps < .05$) than those of SLK-SF-40 and SLB-SF-38 (and its subscales).

Note. ^aUnless otherwise specified by the superscript “n.s.” which denotes statistical non-significance, all other Z-scores of difference were significant at $p < .05$ (two-tailed) (i.e., $|Z\text{-score}| > 1.96$). ** $p < .01$ (two-tailed). *** $p < .001$ (two-tailed). MITC: Mean inter-item correlations. SLB-SF-38-Total: Scale score of the six-factor, 38-item Service Leadership Behavior (SLB) Scale; SLA-SF-46-Total: Scale score of the eight-factor, 46-item Service Leadership Attitude (SLA) Scale; SLB-SF-38-F1: SLB Factor 1 “Self-improvement and self-reflection”; SLB-SF-38-F2: SLB Factor 2 “People and principles orientation”; SLB-SF-38-F3: SLB Factor 3 “Resilience”; SLB-SF-38-F4: SLB Factor 4 “Social competence”; SLB-SF-38-F5: SLB Factor 5 “Problem-solving”; SLB-SF-38-F6: SLB Factor 6 “Mentorship”; SLA-SF-46-F1: SLA Factor 1 “Vision and competence”; SLA-SF-46-F2: SLA Factor 2 “People orientation”; SLA-SF-46-F3: SLA Factor 3 “Caring disposition”; SLA-SF-46-F4: SLA Factor 4 “Ethical role model”; SLA-SF-46-F5: SLA Factor 5 “Social competence”; SLA-SF-46-F6: SLA Factor 6 “Self-understanding and reflection”; SLA-SF-46-F7: SLA Factor 7 “Positive view about human beings”; SLA-SF-46-F8: SLA Factor 8 “Unchangeable and dark human nature”.

These findings suggested that while individuals knowing more about Service Leadership may be more prone to *think* or *feel* (i.e., attitude) and to *act* (i.e., behavior) as an effective Service Leader, there seems to be a weaker tie between “knowing” and “practicing what one was preached”.

DISCUSSION

The primary purpose of this study was to examine the factorial validity and convergent validity of the Service Leadership Knowledge Scale in a sample of Hong Kong undergraduates. Reliability analyses highlighted the excellent internal consistency amongst the 40 items which formed the SLK-SF-40. Consistent with our predictions, results of the CFA corroborated the unidimensionality of the SLK-SF-40, as both the goodness-of-fit indices and individual parameter estimates indicated that the proposed one-factor solution fits excellently with the data. Furthermore, the SLK-SF-40 correlated significantly and positively with all the external criterion scales. The SLK-SF-40 also correlated positively with the two other Service Leadership scales. Both these correlational findings offer convergent evidence for the SLK-SF-40, as instruments measuring i) the same underlying construct (i.e., SLB-SF-38 and SLA-SF-46) and ii) theoretically relevant constructs (i.e., IRI, MSC) all related consistently and positively to the SLK-SF-40. In summary, the present findings underscore the adequacy of SLK-SF-40 in measuring students' knowledge in Service Leadership.

While the findings overall support the validity and reliability of the SLK-SF-40, there are observations worthy of attention. First, the effect sizes of the *Knowledge-Servant Leadership* correlation ($r = 0.20$) and the *Knowledge-Efficacy* association ($r = 0.13$) are noticeably smaller compared to that of the *Knowledge-Empathy* ($r = 0.44$) and the *Knowledge-Moral Self-concept* ($r = 0.36$) associations. These findings may reflect the differential coverage of the constructs within the SLAM framework. As discussed above, *Moral character* constitutes the cornerstone of the SLAM framework (i.e., the “ $E = MC^2$ ” principle). Likewise, empathy is extensively covered as a fundamental attribute of *Caring Disposition* [38]. *Servant Leadership* and *Leadership Efficacy*, by contrast, are not as central to the SLAM framework despite being two highly relevant constructs. In particular, the disregard of self-interest, which is a hallmark attribute in the *Servant Leadership* theory [39], is even at odds with a Core Belief of the SLAM framework [21].

Second, comparison of the correlational strengths underlined a discrepancy between the *Knowledge-Attitude* ($r = 0.34$) tie vis-à-vis the *Knowledge-Behavior* association ($r = 0.18$), implying that Service Leadership may be easier-said-than-done. However, as theorized in the Theory of Planned Behavior (TPB) [39], while *attitude* and perceived behavioral control (which involves *knowledge*) constitute two key contributors of behavioral intention (BI), BI is also determined by a perception of whether a particular behavior would lead to others' approval (i.e., normative beliefs [NB]). In other words, although both *attitude* and *knowledge* are essential to the formation of intent to behave like a Service Leader, there is an additional element in NB (perception of whether acting as a Service Leader would be well-received by relevant others) to be taken into consideration. Hence, the current observed differential correlation strengths amongst knowledge, attitude, and behavior are actually in line with the TPB [39]. This would be an interesting direction for future research.

As a continuation of the PolyU research team's effort, the current study marks the concluding step of the creation (plus validation) of the assessment tool aimed to measure people's understanding of Service Leadership. Specifically, the present paper came up with a much-shortened version of the knowledge scale (i.e., SLK-SF-40) which was demonstrated to be valid and reliable. Not only is a shorter survey easier to administer, crucially, meta-analytic review findings had also consistently pointed to how shorter questionnaires are linked to higher response rates and avoidance of low-quality data due to response burden [40, 41]. In response to Shek et al.'s [10] appeal to develop an assessment instrument which facilitates cross-institutional comparisons on students' understanding of the SLAM framework, alongside adding to the literature on systematic evaluation of Service Leadership education, the present study produced a refined, "participant-friendly", and most importantly, a psychometrically sound measurement tool in the SLK-SF-40.

All in all, in conjunction with the previous studies, there is a strong evidence base for the different versions of the Service Leadership Knowledge Scale. In future, more work could be done to further examine the criterion-related validity of the different versions of the scale. Besides, the relationship between Service Leadership knowledge and actual Service Leadership behavior deserves investigation using longitudinal research designs.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this chapter is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

To cultivate leadership of university students under the service economy, there is a need to help them develop positive attitude towards service leadership. Unfortunately, validated service leadership attitude measures do not exist. In this chapter, validation of the Service Leadership Attitude Scale was reported. Based on the responses of 4,486 students, internal consistency, convergent validity and construct validity of the 73-item Service Leadership Attitude Scale (SLA-SF-73) were examined. Exploratory factor analyses further showed that seven stable factors (Vision and Competence, Social Competence, Caring Disposition, People Orientation, Self-Reflection and Self-Understanding, Positive Views about Human Beings, and Ethical Role Models) were abstracted from the final 46-item scale (SLA-SF-46E), providing support for the factorial validity of the scale.

INTRODUCTION

Hong Kong has shifted from a manufacture-oriented economy to a service economy since the 80s of the last century [1]. Till the end of 2016, four service-oriented pillars including banking and investment services, tourism services, logistics transportation and business support services have become the key engines driving the Hong Kong economy [2]. The number of working adults in the service-oriented sectors has increased from 3.14 million in 2011 to 3.31 million in 2016, accounting for 84.57% of all working adults [2], indicating the importance of service industries to the Hong Kong economy. Previous studies have devoted increasing attention to human capital and organizational climate in service sectors [3, 4], which are two primary mechanisms to obtain organizational success by influencing employees [5, 6]. Although traditional research emphasizes the positive influence of the bundles of Human Resource Management (HRM) Practice on human capital and organizational climate, Jiang and his colleagues [7] found other than HRM, both human capital and organizational climate are also positively shaped by a new ideology of leadership, service leadership, in service-economies.

Jiang and his colleagues [7] adopted the definition of service leadership in the study of Schneider and his colleagues [8], which claimed service leadership is essentially a behavioral focus on improving the service quality of an organization. Chung [9] extended the scope (i.e., not service manufacturing) and claimed that service leadership is essentially a behavioral focus on consistently offering quality personal service to meet the demand at individual, organizational, and social levels. Based on the framework of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM) [10], service leadership is featured by seven core beliefs which increase the competitiveness of the service-oriented economy in Hong Kong. First, service leaders believe service leadership is the service satisfying the needs of stakeholders at different levels, including individuals, groups, communities, systems and environments [10], which well responds to the service-dominant logic in the service-oriented economy that all social units compete with service, and compete through service [11]. Second, service leaders believe everyone can be a leader to improve service effectiveness and quality anytime [10], which spurs service innovation as the core competency of a service organization [12]. Third, service leadership supports the notion that leadership effectiveness and service satisfaction are jointly determined by task competencies, unique character and exhibiting care [10], which promotes the effectiveness of relationship marketing and emphasizes on keeping loyal customers by setting their satisfaction as priorities instead of emphasizing on the number of transactions completed. Researchers [1, 13] asserted that this is the most common strategy to retain customers in the service organizations. Fourth, service leaders believe that service leadership aims to ethically promote the competitiveness, abilities, and willingness of offering service to others [10], which is a particular prerequisite of improving service quality in Hong Kong, where the economic return of service does not wholly depend on service quality. Fifth, service leadership is focused on consistently creating personal service to change the life of others, responding to the transformation of profit model from indiscriminate commodities in the manufacture-oriented economy to customized service in the service-oriented economy [14]. Sixth, service leadership is seen as the longest and most competitive business model [10], which can be adopted as a main business model for Hong Kong, considering a majority of its domestic

production is supported by service-related industries. Last, other than specific skills and knowledge, leadership competencies, appropriate character strengths and caring social dispositions are also key requirements for high status positions in the service-oriented economy [10], which highlight that the soft skills are valuable assets in leading people-oriented projects in the service organizations [11].

In order to maintain the competitiveness of the service-oriented economy of Hong Kong in the global market, strengthening the service leadership in the service organizations is a necessity. With the requirement of cognitive and social-emotional competence, service leadership should be introduced before joining the labor market. Hence, the best time to conduct the related education is during tertiary education. To achieve this goal, HKI-SLAM and the Victor and William Fung Foundation cooperated and founded the Fung Service Leadership Education Initiative in 2012, and William Fung Foundation resolved to allocate HK\$40 million to design and conduct education programs of service leadership among college students in eight publically funded tertiary institutions in Hong Kong. The initiative aimed at promoting service leadership among local college students. Although the eight universities designed and implemented the courses and projects based on their own needs, there is a call for valid scales measuring service leadership attitude, knowledge and behavior to evaluate the effectiveness of these courses and projects as well as comparing the evaluation outcomes cross eight universities.

In the framework of cognitive and behavioral development, attitude plays an important mediation role connecting knowledge and behavior [15-17]. Knowledge can positively shape attitude, which in turn leads to the formation of a behavioral intention [15]. Ajzen [15] argued the more favorable the attitude, the stronger should be the person's intention to perform the specific behavior under consideration. Unfortunately, although attitude to service leadership is important, there has been no valid scales measuring service leadership attitude in Hong Kong-based college students. To fill the gap, a 132-item scale (SLA-LF-132) was initially developed to measure service leadership attitude among local college students by our team based on the SLAM framework, 25 principles of service leadership [18], 12 dimensions of a service leader [19] and relevant literature authored by Shek and his colleagues [20, 21]. The 132-item scale showed good content validity [22]. Based on the preliminary criterion-related validation results which are unpublished, 73 items were retained as the short version (SLA-SF-73). In this chapter we aim to explore the internal consistency, convergent validity and factorial validity of these 73 items.

OUR STUDY

The participants were sampled from undergraduate students of eight publically funded universities in Hong Kong. Students from each university were invited to fill out a customized online survey. The purpose of the research and how the data would be used were presented to students at the title page of the survey. Students were informed they have the rights to stop the online survey anytime. The title page also revealed that all information would be kept confidential and the individual identity of students would not be disclosed at any point. Students were informed that a supermarket voucher worth HK\$100 (roughly equivalent to US\$13) would be given to them upon successful completion of the whole

survey with 252 items which would be completed within 45-60 minutes. The survey would not be activated unless students gave formal consent to be the participants of this study.

The online survey covered the measures of service leadership attitude, knowledge, behavior, external criterion measures and demographic attributes. It was administered in English. The link to online survey was offered to students with the assistance of administrators in eight universities. The data were collected between late March and early June, 2017.

Measures

- 1) **Service Leadership Attitude Scale (SLA-SF-73).** Students were invited to respond to 73 items on a 6-point Likert scale ranging from “1” (strongly disagree) to “6” (strongly agree).
- 2) **Service Leadership Knowledge Scale (SLK-SF-40).** The original 200-item scale (SLK-LF-200) was also developed based on the literature related to the SLAM framework, service leadership and service leader [18-21]. The 200-item scale showed good content validity [23]. The initial criterion validation study shortened the 200 items to 63 items [24]. After considering the face validity and duplication of the items, 63 items were further shortened into 50 items (SLK-SF-50). After evaluating the internal consistency, 50 items were shortened into 40 items (SLK-SF-40). Factor analyses reported in a book chapter in this book showed that the scale possessed excellent factorial validity. These 40 items were used in this study and presented in the form of multiple choice questions. Value “1” was assigned to all correct answers and Value “0” was assigned to all incorrect answers. The Cronbach’s alpha cross all items was 0.93 (mean inter-item correlations = 0.21). The score of service leadership knowledge was calculated as the sum of all 40 items. A higher total score indicates a higher level of knowledge.
- 3) **Service Leadership Behavior Scale (SLB-SF-38).** Based on the aforementioned literature on service leadership and other published work on leadership [25, 26], a 97-item scale (SLB-LF-97) was developed to measure the extent to which the respondents demonstrated the behaviors that are representative of a service leader. On the basis of a Principal Axis Analysis (PAA) conducted, 97 items were shortened into 65 items (SLB-SF-65). After one round of Principal Component Analysis (PCA, see book chapter in this book) and one round of Confirmatory Factor Analysis (CFA) conducted, 65 items were further shortened into 38 items (SLB-SF-38), which demonstrated good convergent validity. Six stable factors were identified in the 38 items. They were Self-Improvement and Self-Reflection, People and Principle Orientation, Resilience, Social Competence, Problem-Solving, and Mentorship. The 38 items were adopted in this study. The items were formulated as statements, and responses were given on 6-point Likert items (1: very dissimilar to me; 6: very similar to me). The Cronbach’s alpha cross all 38 items was 0.96. The Cronbach’s alpha of the items of six subscales ranged from 0.85 to 0.91 (mean inter-item correlations ranged from 0.42 to 0.65). The score of service leadership behavior was calculated as the mean of all 38 items.

- 4) **Revised Servant Leadership Profile (RSLP).** RSLP is a 20-item instrument measuring attitudes toward servant leadership, commitment to developing others in the service, skills concerning servant leadership and capacity of leading a team in the service [27]. For each item, the respondent was invited to respond on a 7-point Likert scale with options ranging from “1” (strongly disagree) to “7” (strongly agree). The Cronbach’s alpha across all items is 0.94 (mean inter-item correlations = 0.46). The total score of Servant Leadership was calculated as the mean of all 20 items.
- 5) **Moral Self-Concept (MSC).** The Chinese Adolescent Self-Esteem Scales (CASES) consists of 60 items measuring overall self-esteem and six specific self-esteem including Cognitive, Family, Social, Moral, Body Image, and Physical Performance [28]. MSC is one of them consisting of 8 items [29], which was used to assess the moral self-concept of university students in this study. Students were invited to respond to a 7-point Likert scale with response options ranging from “1” (strongly disagree) to “7” (strongly agree). The Cronbach’s alpha across all items was 0.83 (mean inter-item correlations = 0.44). The total score of MSC was calculated as the mean of all 8 items.
- 6) **Leadership Efficacy (LEF).** LEF was measured by the 8-item scale developed by Murphy [30] with the focus on assessing the generalized capability in the leadership role [31]. Participants were invited to respond to items with a 5-point Likert scale with responses ranging from “1” (strongly disagree) to “5” (strongly agree). Three items were reversely coded. The Cronbach’s alpha across all items was 0.72 (mean inter-item correlations = 0.25). The total score of LEF was calculated as the mean of all 8 items.
- 7) **Interpersonal Reactivity Index (IRI).** IRI is a 28-item self-reported scale in which 7-item subscales were extracted: Empathic Concern (EC), Perspective Taking (PT), Fantasy (FS) and Personal Distress (PD) [32]. The present study only measured the first two aspects with a total of 14 items. Participants were invited to respond on a 5-point Likert scale ranging from “1” (Does not describe me well) to “5” (Describe me very well). The Cronbach’s alpha across all items was 0.74 (mean inter-item correlations = 0.17), while the Cronbach’s alpha across EC and PT were 0.62 and 0.59 respectively (mean inter-item correlations were 0.19 for both measures). The score of interpersonal reactivity, empathic concern, and perspective thinking were calculated as the mean of relevant items.

Data Analysis

The item-total correlation of each of 73 items was examined using SPSS 23 (IBM, New York), and those with item-total correlation less than 0.25 were dropped. Then we randomly and evenly split the data into two sets: A and B. Set A was adopted for main analysis and Set B was only used to test the factorial structural stability. We performed the Principal Components Analysis (PCA) with varimax rotation to investigate the factor structure. Coefficients of congruence [33] were computed to test the factorial stability by quantifying the similarity of the factor structure across two subsamples. Only items with the factor loading equaled to or above 0.50 were retained. Regarding reliability, the Cronbach’s alpha

value was adopted to examine the internal consistency. For convergent validity, correlation analysis was used to evaluate the association between the scores of SLA (and its subscales) and the scores of SLK-SF-40, SLB-SF-38 (and its subscales), RSLP, MSC, LEF, IRI, EC and PT respectively.

Considering the attitude of service-oriented organizational citizenship is positively related with the related knowledge [34], we hypothesized SLA would be positively correlated with SLK-SF-40 (Hypothesis 1). As how one believes about leadership to some extent directs one's behavior when performing the duties as a leader [15, 17], it was hypothesized that SLA would be positively associated with SLB-SF-38 and its subscales (Hypothesis 2a to 2f). Given that the basic propositions are consistent with those of service leadership, it was hypothesized that SLA would be positively correlated with RSLP (Hypothesis 3). Considering service leaders normally believe that good leaders must be of high moral quality [22], this study hypothesized that SLA would be positively associated with MSC (Hypothesis 4). Considering service leaders should have a positive attitude toward a commitment to continuous improvement in service leadership [22] and that positive attitude is positively correlated with self-efficacy [15], it was hypothesized that SLA would be positively associated with LEF (Hypothesis 5). As service leaders should have multiple intrapersonal and interpersonal competencies [22], so SLA would be expected to be positively correlated with IRI (Hypothesis 6). Besides, as service leaders are expected to exhibit care to peers and subordinates, and empathic concern is an important prerequisite to exhibit care [35], SLA would be expected to be positively correlated with EC (Hypothesis 7). Considering service leadership model posits that service quality should be judged by service receivers and the service provided based on the needs of service receivers is more likely to lead to their satisfaction [36], SLA would also be expected to be positively correlated with PT (Hypothesis 8).

WHAT WE FOUND

A total of 4,555 completed questionnaires were received by the research team. After excluding those declining to participate ($n = 6$), multiple participation ($n = 33$), ineligible responses ($n = 30$), the final sample consisted of 4,486 undergraduate students. Around 500 students were affiliated to each university except for The Hong Kong Polytechnic University, whose sample was doubled to around 1,000. Among the 4,486 respondents (i.e., Mean age = 20.47; SD = 1.67), 1,517 (33.8%) were male and 2,969 (66.2%) were female. The full data set was randomly split into two sets: Set A contained 2,246 respondents, whereas Set B was composed of 2,240 respondents.

Factor Structure

After checking the item-total correlation coefficients, 9 items with values less than 0.25 were deleted from the original 73-item scale. To avoid double loading and to derive a conceptually meaningful picture, a seven-factor solution was tested. The solution could explain for 53.67% of the whole variance. The factor loading of all items was over 0.30.

Table 1 reports the factor loadings of all items. Seven factors identified were Vision and Competence (18 items), Social Competence (8 items), Caring Disposition (13 items), People Orientation (11 items), Self-Reflection and Self-Understanding (5 items), Positive Views about Human Beings (3 items), and Ethical Role Models (6 items). Based on this finalized factor structure, the coefficient of congruence across two subsamples was 0.97 and the coefficient of congruence of each subscale ranged from 0.96 to 0.98 (see Table 2), indicating that the seven-factor structure across two subsamples was almost the same [33]. After removing 18 items with the factor loading less than 0.50 to keep a more robust factor solution, the finalized 7-factor scale contained 46 items (SLA-SF-46E). In another paper under preparation, CFA was further conducted to look at the factor structure of the scale.

Table 2. Coefficients of congruence across two subsamples (N = 4,486)

	Between two random sub-samples
Service Leadership Attitude Scale (SLA-SF-73)	0.97
SLA-SF-73 - Vision and Competence	0.98
SLA-SF-73 - Social Competence	0.97
SLA-SF-73 - Caring Disposition	0.98
SLA-SF-73 - People Orientation	0.97
SLA-SF-73 - Self-Reflection and Self-Understanding	0.97
SLA-SF-73 - Positive Views About Human Being	0.96
SLA-SF-73 - Ethical Role Model	0.97

Internal Consistency and Convergent Validity

Full SLA-SF-46E and its seven subscales demonstrated high internal consistency. The Cronbach's value of full SLA-SF-46E scale was 0.96 and those of subscales were between 0.70 and 0.91 (see Table 3), showing good internal consistency. As expected, the scores of SLA-SF-46E and seven subscales were all positively correlated with those of SLK-SF-40, SLB-SF-38, RSLP, MSC, LEF, IRI, EC, and PT (see Table 4). Consistently, the scores of

SLA-SF-46E and seven subscales were found positively associated with the scores of each subscale of SLB-SF-38 (see Table 5). The findings supported all hypotheses, establishing the convergent validity of SLA-SF-46E and seven subscales among Hong Kong undergraduate students.

Table 3. Internal consistency of Service Leadership Attitude Scale (SLA-SF-46E) and external criterions scales (N = 2,246)

	α	Mean Inter-item correlations
Service Leadership Attitude Scale (SLA-SF-46E)	0.96	0.36
SLA-SF-46E - Vision and Competence	0.91	0.46

DISCUSSION

This study reported the shortening of the SLA-LF-73 from 73 items to 46 items after factor analyses based on 4,468 college students in Hong Kong, and tested the reliability, convergent validity and factorial validity of the 46-item scale. Exploratory factors analyses showed that seven factor emerged from the scale and this seven-factor structure was stable across two sub-samples of Hong Kong college students. Based on the cut-offs of inter-item correlation and factor loading, 73 items were further shortened into 46 items. The findings suggested that both the full scale and seven sub-scales demonstrated excellent reliability status. In addition, both the 46-item scale and all seven sub-scales demonstrated convergent validity, which is proven by their significant correlations with SLK-SF-40, SLB-SF-38 (and sub-scales), RSLP, MSC, LEF, IRI, EC, and PT.

As expected, there were positive correlations between SLA-SF-46E and SLK-SF-40, echoing to a series of previous findings that knowledge and information establish the understanding of importance of a subject, shaping positive attitudes toward it at the next stage [33, 37]. SLA-SF-46E was found positively correlated with SLB-SF-38 and its subscales, which is consistent with the theory of planned behavior that positive attitude is able to shape positive behavior through behavioral intentions [15]. There were positive correlations detected between SLA-SF-46E and RSLP, echoing the common philosophy and practices of both service leadership and servant leadership that enrich the lives of individuals and create a caring environment [27]. Besides, SLA-SF-46E was positively correlated with MSC, which is consistent with the core philosophy of service leadership that service leaders should possess moral character and practice following the principles of integrity, fairness, and humanity [22]. For service leaders, the strong motivation of being ethical role models make them take efforts to shape their moral character and improve their moral self-concept, causing the strong positive correlations between SLA-SF-46E and MSC. As expected, SLA-SF-46E was positively correlated with LEF as confidence is normally generated from the behavior and experience and positive attitude always drives positive behaviors [38]. SLA-SF-46E was found positively correlated with IRI, echoing the core belief of service leadership that service

leaders should demonstrate interpersonal and intrapersonal competencies in terms of the willingness of collaborating with peers, the capacity of addressing conflicts within a team, and capabilities in constructing communication channels to promote information exchange [22]. More specific, the positive correlations between SLA-SF-46E and EC are consistent with the literature that empathic concern increases the likelihood of exhibiting care, which is believed to be one of the core practices of service leaders [35]. The positive correlations between SLA-SF-46E and PT echo the literature that thinking from the perspective of service receivers is positively associated with their satisfaction on the service received [36].

This study helps to develop a briefer and focused measure of service leadership attitude for Hong Kong undergraduate students. The SLA-SF-46E is important to local universities in view of the need to objectively evaluate service leadership programs, which has long-term impacts on the healthy operation of the Hong Kong's service economy.

Although current study makes a sound contribution, some limitations should be noted. First, the study examined service leadership attitude and behavior by directly asking students only without checking the accuracy of their answers by comparing with the assessment from the perspective of teachers and peers. Similar to other self-report measures, it is noteworthy that social desirability may cloud the findings. Comparatively, their attitudes and behavior may be more accurately recognized by teachers and peers, suggesting future studies should invite teachers and peers to rate the same items. Second, the data in this study are from eight publically funded universities only. It is noteworthy that there are a number of undergraduate students studying in the self-funded tertiary institutions. Future studies might consider extending the sample of this study to cover students in self-funded tertiary institutions. Third, as the sample adopted in this study is essentially a convenient sample, there is a problem of generalizability of the findings, which should be addressed in future studies.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

Utilizing a sample of 4,486 Hong Kong undergraduates recruited from eight government-funded universities, this chapter reports the findings of a cross-institution validation study on the Service Leadership Behavior Scale (Short-Form) with 65 items (SLB-SF-65). Specifically, we examined the internal consistency, convergent validity, as well as the dimensionality of the SLB-SF-65. Results of the exploratory factor analysis indicated that six factors could be extracted with 48 items retained in the trimmed version

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

of the scale (SLB-SF-48) with a stable factor structure. Besides, the overall scale showed excellent internal consistency and was positively correlated to a myriad of theoretically relevant constructs. In short, the present findings underscored the adequacy of the trimmed Service Leadership Behavior Scale (SLB-SF-48) as an objective assessment to gauge whether one possesses the behavioral qualities of a Service Leader.

INTRODUCTION

As an emergent leadership paradigm in advanced economies [1, 2], the Service Leadership paradigm, contrary to the traditional elitist leadership models, contends that leadership success should extend beyond discipline-oriented knowledge or task-specific competencies (i.e., the “hard (or *product*) skills”) to cover “soft (or *process*) skills” including interpersonal communication and intrapersonal qualities [3, 4]. As Shek and colleagues [5] remarked, such a paradigm which “calls for leaders with qualities to serve others” (p. 164) and inspires a revamp in leadership initiative, informs education and research which are instrumental to Hong Kong where service takes up a whopping 92.2% of GDP [6]. As such, Po Chung, Chairman of the Hong Kong Service Leadership and Management Limited (HKI-SLAM), initiated the notion of Service Leadership education targeting university students of Hong Kong (i.e., SLAM framework).

With the financial support of the Victor and William Fung Foundation and the collaborative effort of the HKI-SLAM and the government, a multi-year project entitled the “Fung Service Leadership Education Initiative” was implemented in eight government-funded universities. On the basis of the SLAM framework, each participating institution would design her own curriculum aimed to promote students’ Service Leadership attributes (see 7). Specifically, Po Chung highlighted Competence (i.e., “Doing things right”), Moral character (i.e., “Doing the right things”), and Caring disposition (i.e., “Serving with unselfish intent”) as the three defining attributes in building a leader’s legitimacy and thereby contributing to leadership success [8, 9]. Hence, the formula “E (Effective leadership) = M (Moral character) C² (Competence * Caring)” laid the conceptual foundation for the model of Service Leadership education [10].

To objectively assess qualities of effective Service Leaders [11], the research team at The Hong Kong Polytechnic University (PolyU) initiated a project entitled “Development and validation of measures based on the Service Leadership Model (“The Project” hereafter)” [5]. Via developing and validating three scales on attitude, behavior, and knowledge corresponding to the three dimensions argued to define the educational success of Service Leadership [12], Shek and colleagues [5] endeavored to develop reliable and valid assessment tools to judge whether an individual is a good Service Leader. In this chapter, findings of a large-scale validation study of the Short-Form of Service Leadership Behavior Scale (SLB-SF-65) are reported.

The long-form Service Leadership Behavior Scale (SLB-LF-97) was developed to measure the “behavioral qualities a Service leader should demonstrate” [5, p. 165]. Operating on a six-point Likert Scale (1: very dissimilar; 6: very similar), the SLB-LF-97 includes 97 items developed based on the SLAM framework, 25 principles of Service Leadership [8], and the leadership literature [e.g., 13-15]. These 97 items cover four main dimensions, including

i) service provision, ii) principle “ $E=MC^2$,” iii) commitment to continuous improvement, and iv) distributed leadership.

As part of “The Project” [see 5], a validation study involving 231 PolyU undergraduates was conducted in November 2016 to examine the psychometric properties and factorial structures of the 97-item SLB-LF-97. The results highlighted the excellent reliability of the SLB-LF-97 ($\alpha = 0.97$) and its moderate to strong correlations (r s ranging from 0.51 to 0.81) with several theoretically relevant constructs including Servant Leadership [16], empathy [17], moral self-concept [18], and leadership efficacy [19, 20]. Meanwhile, findings of the exploratory factor analysis (EFA) suggested the removal of 32 items due to the double-loading [21] and insufficient-loading issues (i.e., loadings less than 0.40) [see 22]. Ultimately, 65 items were retained to form the Short-Form of the Service Leadership Behavior Scale (SLB-SF-65).

While the above unpublished study pioneered the convergent validation and the analysis of the dimensionality of the initial behavior scale (i.e., SLB-LF-97), there is a need to replicate the psychometric soundness and to re-examine the dimensionality of the trimmed scale using on a larger sample. As the main body of “The Project,” the present study utilized a sample of 4,486 undergraduates to examine the item homogeneity, convergent and factorial validity of the 65-item SLB-SF-65. Specifically, this chapter is mainly focused on reporting the results of the EFA, in addition to analyses of the internal consistency and convergent validity of the SLB-SF-65.

OUR STUDY

Utilizing an e-platform, a total of 4,486 undergraduates (mean age: 20.47 years; SD: 1.67) from eight government-funded universities participated in the Service Leadership Scales validation study. Amongst the 4,486 respondents, 1,517 (33.8%) were males and 2,969 (66.2%) were females. An overwhelming proportion of the participants were aged 20 to 24 years (68.4%), had neither received any credit-bearing (74.3%) nor non-credit-bearing (82.0%) training in Service Leadership, despite the fact that 64.4% had formerly served as a leader (such as being the chairperson of a student association). Furthermore, 77.1% sat the Hong Kong Diploma of Secondary Education Examination (HKDSE). Details regarding other demographic information of the present working sample are addressed in another chapter in this book.

Procedures

The data collection, which commenced in March 2017, was implemented via the mySurvey@PolyU electronic survey system. The research objectives, instructions on how to complete the present self-administered survey, participants’ rights to voluntarily participate and withdraw, and the principle of data confidentiality were highlighted in the invitation documents and on the survey webpage. Participants were also informed that 45 to 60 minutes would be warranted to conscientiously complete the entire questionnaire. Students’ informed

consent was obtained at the start of the e-survey. Upon the completion of the study, each participant was entitled to a supermarket cash coupon valued at HK\$100 (US\$12.80).

Participants’ completed responses were downloaded as an EXCEL file for a data-cleaning process before the conversion to an SPSS file for statistical analyses. Details on the various steps taken and criteria as regards the eligibility of the responses were reported in another chapter in this book. Ultimately, 4,486 cases were considered eligible for further analyses.

Instruments

The present e-survey was composed of items from the Short-Forms of the Service Leadership scales, including i) the Service Leadership Attitude Scale (SLA-SF-73; 73 items), ii) the Service Leadership Behavior Scale (SLB-SF-65; 65 items), and iii) the Service Leadership Knowledge Scale (SLK-SF-50; 50 items). The present chapter is primarily concerned with the validation of the 65-item Service Leadership Behavior Scale (SLB-SF-65).

Developed based on the SLAM framework, 25 principles of Service Leadership [8], and other published works on *leadership* [e.g., 15, 23], the 97-item Service Leadership Behavior Scale (i.e., SLB-LF-97) was constructed to examine the extent to which an individual demonstrates behaviors that are representative of a Service Leader. Sixty-five items were ultimately retained to form the SLB-SF-65, following an unpublished validation study involving 231 PolyU undergraduates as part of the project “Development and validation of measures based on the Service Leadership Model” [see 5]. The SLB-SF-65, which is in English with a six-point Likert Scale (1: very dissimilar; 6: very similar), describes some leaders’ behaviors whereby participants rate how each description resembles their behaviors if they are in a position to lead. Table 1 features four sample items of the SLB-SF-65.

Table 1. Four sample items of the SLB-SF-65

Items	Very Dissimilar to Me	Moderately Dissimilar to Me	Slightly Dissimilar to Me	Slightly Similar to Me	Moderately Similar to Me	Very Similar To Me
15. I trust myself in tackling difficulties in my life.	1	2	3	4	5	6
36. I have no problem letting others know my shortcomings.	1	2	3	4	5	6
49. I can motivate myself to achieve any goals I set.	1	2	3	4	5	6
64. I impose total control over duties assigned to other individuals. (Reverse-item)	1	2	3	4	5	6

Note. All sample items were slightly re-worded due to copyright issues.

Four other validated scales as listed below from the leadership and personality literature were also administered, with the aim of ascertaining the convergent validity of the SLA-SF-73, the SLB-SF-65, and the SLK-SF-50. These validated external inventories included the 20-item Revised Servant Leadership Profile (RSLP), the 8-item Leadership Efficacy Scale

(LEF), the 8-item Moral Self-Concept Scale (MSC), plus 14 items selected from Interpersonal Reactivity Index (IRI). There were also forced-choice and open-ended items aimed to measure the respondents' demographics.

1. **Revised Servant Leadership Profile (RSLP):** The RSLP was developed by Wong and Page [24] to assess the multidimensional construct *Servant Leadership*. In this study, 20 items from five dimensions deemed relevant to the SLAM curriculum—including, i) *Empowering and developing others* (five items), ii) *Serving others* (seven items), iii) *Open, participatory leadership* (two items), iv) *Inspiring leadership* (two items), and v) *Integrity and authenticity* (four items)—were included. The RSLP operates on a seven-point Likert scale. A higher score indicates higher likelihood to behave like a *Servant Leader*. Reliability analyses underscored the high item homogeneity of RSLP ($\alpha = 0.94$; mean inter-item correlations = 0.45).
2. **Leadership Efficacy Scale (LEF):** Developed by Murphy [20], the LEF comprises eight items designed to tap into people's "confidence in their general leadership ability" [19, p. 270]. Items were rated on a five-point Likert scale, with a higher score symbolizing one's perceived capability to take on a leadership role. Reliability analyses demonstrated an acceptable internal consistency amongst the eight items ($\alpha = 0.73$; mean inter-item correlations = 0.27).
3. **Moral Self-Concept (MSC):** Developed and validated by Cheng [18] as a subscale under the Chinese Adolescent Self-Esteem Scales (CASES), the MSC, which consists of eight items, examines youngsters' self-appraisal on dimensions pertaining to i) *Conduct and virtues*, ii) *Self-control and discipline*, and iii) *Altruism*. Items were rated on a seven-point Likert scale, with a higher score indicative of one's value of *morality* to him/herself, which is a cornerstone of effective leadership based on the SLAM curriculum [25]. In this study, we adopted the English-translated and slightly amended version of the MSC. Reliability assessment indicated a good internal consistency of the MSC on the current sample ($\alpha = 0.83$; mean inter-item correlations = 0.44).
4. **Interpersonal Reactivity Index (IRI):** Developed by Davis [17] and tested across nations and languages [see 26-28], the IRI is the most widely utilized inventory in assessing empathy as a multidimensional construct [29]. The 14 items utilized in the present study were from subscales *Perspective Taking* (PT; seven items) and *Empathic Concern* (EC; seven items). All items were rated on a five-point Likert scale. A higher score, according to Shek and Yu [30], denotes a higher level of empathy which is crucial for effective leadership. Besides computing the component scores for both subscales, a composite IRI score was also calculated. Cronbach's alpha for subscales PT and EC and the composite IRI score were 0.59, 0.62, and 0.74, respectively.

We performed both exploratory (EFA) and confirmatory factor analyses (CFA) in the present validation study. SPSS statistics version 24.0 (IBM) was used to perform the EFA, descriptive analyses, and measurement of internal consistency and convergent validity. AMOS 24.0 (IBM) statistical package was utilized to perform the CFA. The present chapter is primarily concerned about reporting the findings of the PCA, the internal consistency and

convergent validity of the 65-item SLB-SF-65. Details regarding the CFA and the final version of the behavior scale with 38 items will be addressed in another paper under preparation.

To explore the factorial structure of SLB-SF-65, we administered the EFA using the principal component analysis (PCA) with varimax rotation. The aggregate dataset (N= 4,486) was split into two random subsets, namely subset A (N= 2,246) and subset B (N= 2,240). The PCA was performed on subset A to explore the dimensionality of SLB-SF-65, whereby CFA was administered on subset B with the purpose of finalizing a factorial structure of the SLB-SF-65. Meanwhile, to establish the stability of the factorial structure, we performed the identical PCAs on subsets A and B. The Tucker’s coefficients of congruence (r_c) were then computed to gauge the resemblance of factor structures across subsets A and B [31, 32].

Cronbach’s alpha values and item-total correlations were computed to assess the internal consistency of the scale and the individual factor (i.e., subscale) derived. Regarding the assessment of convergent validity, the composite scores—computed via averaging respondents’ ratings—of both the scale and the subscales were correlated with the four external criterion measures adopted at present. Since the SLAM curriculum which preaches the behavioral prerequisites of a Service Leader covers domains in *Servant Leadership*, *leadership efficacy*, *morality* and *empathy*, it is logical to hypothesize a positive and significant correlation between the behavior scale (and the subscales) and the i) RSLP, ii) LEF, iii) MSC, and iv) IRI (including subscales EC and PT). Correlational analyses with other Service Leadership scales under validation were also performed. Considering that all these scales were designed to tap into different dimensions (i.e., *knowledge*, *attitude*, and *behavior*) of Service Leadership, there is no reason not to expect significant positive correlations amongst the behavior scale (with the subscales) and the validated versions of the SLK-SF-50 and the SLA-SF-73 (and the subscales).

FINDINGS

Table 2. Eigenvalues and total variance explained for the analyses on subset A and B

	Subset A (N= 2,246)		Subset B (N= 2,240)	
Factors	Eigenvalues	Total Variance Explained (%)	Eigenvalues	Total Variance Explained (%)
1	23.85	36.69	23.90	36.77
2	2.96	41.25	3.01	41.40
3	2.56	45.18	2.51	45.26
4	2.12	48.44	2.28	48.77
5	1.77	51.17	1.70	51.38
6	1.57	53.58	1.63	53.88
7	1.46	55.82	1.44	56.10
8	1.24	57.73	1.26	58.03
9	1.14	59.48	1.07	59.67
10	1.02	61.05	1.01	61.22
11	0.99	62.58	0.99	62.74

Note. Eigenvalues for the remaining factors are all below unity.

SLB-SF-65	4.46	0.57	0.87	0.87		0.80	0.82	0.72	0.69			
SLB-SF-48	4.50	0.60	0.88	0.86		0.80	0.82	0.74	0.69			

Note. N = 2,246; M: mean scores; SD: standard deviation. Bold and underlined values are the highest loadings by a variable among the factors which are over 0.50. ITC: item-total correlation. Forty-eight items were retained for the CFA in which 38 items were retained to form the finalized version of the scale. SLB-SF-65: 65-item Short-Form Service Leadership Behavior Scale; SLB-SF-48: the six-factor, 48-item solution to be subjected to CFA. S1: Subscale 1 (12 items, *Self-improvement and Self-reflection*); S2: Subscale 2 (12 items, *People and Principles Orientation*); S3: Subscale 3 (8 items, *Resilience*); S4: Subscale 4 (7 items, *Social Competence*); S5: Subscale 5 (6 items, *Problem-Solving*); S6: Subscale 6 (3 items, *Mentorship*). All correlation coefficients are statistically significant at $p < .001$ (two-tailed).

While ten factors were shown to have eigenvalues over unity across the two subsets (see Table 2), visual inspection of both scree plots and consideration of interpretability of the factor solution suggested that six factors which accounted for 53.58% of the total variance could be retained. Accordingly, the PCA was rerun on subset A specifying the extraction of six factors. The factor loadings of each item, eigenvalues, the percentage of variance explained by each factor, and the correlations amongst the factors and the entire scale are detailed in Table 3.

To assess the stability of this six-factor solution, we computed the coefficients of congruence (r_c) across subsets A ($N=2,246$) and B ($N=2,240$). As illustrated in Table 4, the value of r_c of SLB-SF-65 across subsets is 0.99, indicating that the six-factor structure was essentially identical across the two subsets [32]. Additionally, the r_c of the six factors across these two random subsamples are all above 0.98 (see Table 4). In short, these findings corroborate the stability of the factors derived [33].

With the objective to simplify and thereby lead to a more stringent interpretability of the factorial structure, 17 items with loadings below 0.50 were removed [34, 35]. The resultant 48-item, six-factor solution (SLB-SF-48) was then subjected to a confirmatory factor analysis (CFA), which will be discussed in detail in another paper under preparation. The six factors, each of which forms a subscale, were accordingly named “Self-improvement and Self-reflection” (items 47 to 58), “People and Principles Orientation” (items 1, 32, 37 to 42, 60 to 62, and 65), “Resilience” (items 11 to 13, 15 to 19), “Social Competence” (items 20 to 22, 24 to 27), “Problem-Solving” (items 4 to 9), and “Mentorship” (items 43 to 45).

Table 4. Coefficient of congruence across two subsamples

	Between two random subsamples (subset A: $N=2,246$; subset B: $N=2,240$)
Short-Form Service Leadership Behavior Scale (SLB-SF-65)	0.991
1: <i>Self-improvement and Self-reflection</i>	0.996
2: <i>People and Principles Orientation</i>	0.996
3: <i>Resilience</i>	0.989
4: <i>Social Competence</i>	0.982
5: <i>Problem-Solving</i>	0.993
6: <i>Mentorship</i>	0.988

Reliability of the Measures

As detailed in Table 5a, the total scale (SLB-SF-65), trimmed scale (SLB-SF-48) and the subscales all demonstrated at least meritorious internal consistency (i.e., all α values $>.80$, mean inter-item correlations $>.30$) across subsets. Similar findings (i.e., all α values $>.80$, mean inter-item correlations $>.30$) emerged (see Table 5b) even when we further split the two subsamples based on the respondents' gender. All items, except for item 64 which was subsequently excluded from SLB-SF-48, had a corrected item-total correlation of at least 0.40 (see Table 4). Taken together, the present findings supported the high reliability of the SLB-SF-48 and its subscales.

Table 5a. Internal consistencies of SLB-SF-65, SLB-SF-48, and subscales across subsamples

	Entire Sample (N= 4,486)		Subset A (N= 2,246)		Subset B (N= 2,240)	
	α	Mean Inter-item correlations	α	Mean Inter-item correlations	α	Mean Inter-item correlations
SLB-SF-65	0.97	0.34	0.97	0.34	0.97	0.34
SLB-SF-48	0.97	0.38	0.97	0.37	0.97	0.38
1: <i>Self-improvement and Self-reflection</i>	0.93	0.53	0.93	0.53	0.93	0.53

Validity Analyses: Correlation with External Criterion Scales (and Subscales)

Consistent with our hypotheses, correlational findings (see Table 6a) revealed that the SLB-SF-48 scores (and the six subscales) correlated significantly (all $ps < .001$) and positively with all external criterion measures. Using the software package *cocor* [36] which permits comparisons of magnitude between two pairs of correlation coefficients [e.g., Steiger's [37] computation of z-score using average correlations), the findings (see Table 6b) revealed that amongst all significant correlations, the SLB-SF-48 correlated most robustly with the *Revised Servant Leadership Profile* ($r = 0.790$) and noticeably more modest with the *Interpersonal Reactivity Index* ($r = 0.412$). In summary, these findings shed light on the convergent validity

of the SLB-SF-48, which was demonstrated to be positively linked with constructs (e.g., a Servant Leadership mindset and one's inner urge to uphold morality) theorized to delineate the behavioral prerequisites for a Service Leader [8, 9].

Table 6a. Correlations with external criterion scales (and subscales)

	External criterion scales

Validity Analyses: Correlation with Other Service Leadership Scales under Validation

As Table 7a shows, the SLB-SF-48 correlated significantly and positively with both the composite scores of the single-factor, 40-item Service Leadership Knowledge (i.e., SLK-SF-40) scale ($r = 0.170$), and the eight-factor, 46-item Service Leadership Attitude (i.e., SLA-SF-46) scale ($r = 0.565$). Details about the validation of SLK-SF-40 and SLA-SF-46 are addressed in two separate chapters in this book. The SLB-SF-48 also correlated positively with most of the subscales of SLA-SF-46. Regarding the six subscales of SLB-SF-48, they are mostly correlated positively and significantly with both the SLK-SF-40 and SLA-SF-46 (including the subscales), despite occasional non-significant or unexpected findings (see Table 7a).

Table 7a. Correlations with other Service Leadership scales (and subscales) under validation

6. SLA-SF-46-F5	0.84 (0.57)	0.467***	—	—	—	—	—	-0.17 ^{n.s.}	8.83	19.50	-9.50
7. SLA-SF-46-F6	0.82 (0.49)	0.470***	—	—	—	—	—	—	8.50	18.10	-7.13
8. SLA-SF-46-F7	0.70 (0.54)	0.261***	—	—	—	—	—	—	—	11.47	-15.37
9. SLA-SF-46-F8	0.78 (0.41)	-0.068**	—	—	—	—	—	—	—	—	-25.12
10. SLA-SF-46-Total	0.94 (0.28)	0.565***	—	—	—	—	—	—	—	—	—

Note. N= 2,246. *** $p < .001$ (two-tailed). α = Cronbach's alpha value. MITC: Mean inter-item correlations. ^aUnless otherwise specified by the superscript "n.s." which denotes statistical non-significance, all other Z-scores of difference were significant at $p < .05$ (two-tailed) (i.e., $|Z\text{-score}| > 1.96$). SLK-SF-40: Scale score of the single-factor, 40-item Service Leadership Knowledge Scale; SLA-SF-46-Total: Scale score of the eight-factor, 46-item Service Leadership Attitude (SLA) Scale; SLA-SF-46-F1: SLA Factor 1 "Vision and competence"; SLA-SF-46-F2: SLA Factor 2 "People orientation"; SLA-SF-46-F3: SLA Factor 3 "Caring disposition"; SLA-SF-46-F4: SLA Factor 4 "Ethical role model"; SLA-SF-46-F5: SLA Factor 5 "Social competence"; SLA-SF-46-F6: SLA Factor 6 "Self-understanding and reflection"; SLA-SF-46-F7: SLA Factor 7 "Positive view about human beings"; SLA-SF-46-F8: SLA Factor 8 "Unchangeable and dark human nature."

Additionally, comparison of the strengths of correlation (see Table 7b) revealed that the strengths of associations between SLB-SF-48 and SLA-SF-46 (including the subscales) were, in general, significantly greater ($ps < .05$) than that of SLB-SF-48 and SLK-SF-40. These results indicated that the display of Service Leadership behaviors would be linked more to whether someone is prone to think or feel (i.e., attitude) like a Service Leader than him/her being more “book-smart” (i.e., knowledge) in the SLAM curriculum.

DISCUSSION

Utilizing a large sample of Hong Kong undergraduates, the present study attempted to validate the Short-Form Service Leadership Behavior Scale. The findings underlined the excellent reliability amongst the items. Results of the EFA suggested a six-factor solution which was demonstrated to be stable across sub-samples, hence providing support for the factorial validity of the 48-item Service Leadership Behavior Scale (SLB-SF-48). Besides, the six subscales were found to correlate significantly and positively with all external criterion measures. The SLB-SF-48 and subscales, which recorded excellent internal consistencies, were also demonstrated to correlate positively and significantly with the two other Serviced Leadership scales. These results provide support for the convergent validity of SLB-SF-48. Taken together, the present analyses lend support to the legitimacy of SLB-SF-48 as a valid and reliable rubric to judge whether someone demonstrated qualities characteristic of a good Service Leader.

There are several contributions of the present chapter. First, in view of the lack of leadership assessment tools in the Chinese context, this is an important addition to the literature. As Chinese people constitute roughly one-fifth of the world's population, objective leadership scales for Chinese people need to be developed. Second, the present findings are important for the Service Leadership literature. As the ever-expanding global economy becomes more service-oriented, this is a timely effort to develop objective tools in this area. Third, the scale permits an objective assessment of Service Leadership behavior which is important for personnel decisions. Employers may wish to employ workers capable of exhibiting Service Leadership behaviors. Fourth, the scale can be used by researchers to evaluate the effectiveness of Service Leadership training programs. Basically, if a training program works, the trainees should show positive changes after completion of the program. Finally, the scale can enable an individual to understand oneself more regarding his/her attributes in Service Leadership.

While the current chapter may have underscored the psychometric soundness and factorial stability of SLB-SF-48, there are still aspects which warrant addressing. First, this chapter focuses only on the exploratory side of the dimensionality assessment of the behavior scale. While an interpretable and stable initial factorial solution has been established, to further quantify and accordingly, ascertain the absolute and relative agreement (i.e., the fit indices) of this six-factor solution with the response data, it is imperative that a confirmatory factor analysis (CFA) be administered [38]. Due to the limitation of word count in this book, the present article is unable to also report the CFA which had been conducted as part of this large-scale validation study. As reiterated throughout this chapter, the findings of the CFA would be detailedly discussed in another paper under preparation.

Second, the *Knowledge-Behavior* link ($r = 0.17$) was noticeably weaker compared to the *Attitude-Behavior* association ($r = 0.56$), implying a disconnect between one's *understanding* and propensity to *practice* in relation to the SLAM curriculum. This may be attributable to the varying nature of different Service Leadership surveys. Unlike the knowledge scale which has a "correct" answer for every item, the behavior and attitude scales are more like an opinion poll. It is, therefore, conceivable that respondents in behavior and attitude scales may respond according to their *personal* or *normative theory* rather than their *genuine stances* on the matter [39]. Social desirability responding may also come into the equation [40]. In other words, instead of indicating whether he/she had previously demonstrated a certain behavioral quality of a Service Leader, a participant may have responded based on what he/she believes a Service Leader *should* do in this situation, or alternatively, he/she may have tried to rate in a particular fashion that presents him/her in a favorable light [41].

In spite of all these shortcomings, this chapter does not only evidence the internal consistency and convergent validity of the SLB-SF-65, but also informs the "rightsizing" of the scale (accordingly forming the SLB-SF-48) which has been well-documented to promote response rate and minimize response burden [see 42 for a review]. As systematic evaluation research in the context of Service Leadership education remains scanty [7, 12], the present chapter constitutes a valuable addition to the literature by presenting a pioneer assessment tool in behavioral qualities of Service Leadership which was demonstrated to be valid and reliable.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this chapter is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University.

ABSTRACT

Guided by the Service Leadership Theory, substantial effort has been devoted to service leadership education in Hong Kong. In contrast, scientific instruments that assess the basic concepts of service leadership are non-existent. As such, we developed three scales pertinent to the notion of service leadership, including knowledge, attitude, and behavior scales. The present study reported the development of norms and psychological correlates of the Service Leadership Knowledge Scale consisting of 40 multiple-choice questions (i.e., SLK-SF-40). Based on a large and representative sample (N = 4,486) of university students recruited from the eight University Grants Committee (UGC)-funded universities in Hong Kong, the results showed that the female students had a significantly higher level of service leadership knowledge than did the male students, resulting in the

separate norms for the two groups. While age did not show significant influence on the students' knowledge score, the students' grade point average (GPA), leadership training experience, and experience of taking leadership roles in university organizations were all positively associated with their service leadership knowledge scores, but the effect size was small. The percentile norms of this knowledge scale developed in this study provide a useful tool for designing, implementing, and evaluating service leadership education programs.

INTRODUCTION

With the growing globalization and rapid technology development which have intensified international economic competition, skilled human capital is deemed vital to sustaining a nation's competitiveness and long-term prosperity [1, 2]. Regarding the list of desirable attributes, leadership is among the most frequently cited ones. As Ewing, Bruce and Ricketts [3] stated, "the future success of local communities, states, and the country is tied to the development of quality leaders" (p. 119).

The increasing need for leadership qualities comes with a great emphasis on leadership education. In particular, higher education institutions have incorporated leadership into their mission statements and included leadership as one of the important student learning outcomes [4-6]. To cultivate leadership qualities among the university students, a vast number of leadership programs in different forms (e.g., curriculum, course, workshop and outdoor training) have been offered to them [7-9]. For instance, with the financial support of the Victor and William Fung Foundation, a large-scale leadership project was launched in eight public universities funded by the University Grants Committee (UGC) in Hong Kong to satisfy the needs of predominant service economy by nurturing "service leaders" [10].

Despite the divergent patterns, common themes of learning goals can be identified for these leadership programs, such as improving leadership knowledge and nurturing a diverse range of leadership attributes [11, 12]. From the perspective of evidence-based practice [13], it is essential to carry out systematic evaluation studies to examine whether these intended learning outcomes are achieved and whether the related leadership education is effective. Unfortunately, rigorously designed evaluation research for leadership education is scarce, particularly in the Chinese culture. One possible reason has to do with the severe lack of valid tools to assess Chinese people's leadership attributes in the dimensions of leadership knowledge, attitudes and behavior.

Service Leadership Education and Evaluation in Hong Kong

With specific reference to Hong Kong, the economic structure has shifted from the manufacturing economy to the service economy which calls for leaders with a service mindset [14]. To facilitate leadership education in the service era, Chung [15] proposed the Service Leadership Theory which defines service leadership as to "satisfy needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" (p. 5). To elaborate, service leadership highlights service orientation and manifest itself in three

realms—self, others, and systems [15, 16]. Furthermore, it is believed that effective service leadership is determined by three key elements: leadership competency including intra- and inter-personal competencies, moral character, and caring disposition [15].

Guided by the Service Leadership Theory and with the financial support of the Victor and William Fung Foundation, the eight UGC-funded universities in Hong Kong have designed and implemented their own service leadership programs, which incorporate knowledge and beliefs of service leadership and aim to nurture critical service leadership qualities (i.e., leadership competency, caring disposition, and moral character) in the university students [10]. For instance, at The Hong Kong Polytechnic University (PolyU), both credit-bearing service leadership subjects embedded in the general education curriculum and the non-credit bearing programs have been offered to the students since the 2012/2013 academic year [17]. In addition, PolyU and other universities in mainland China jointly organized several intensive service leadership training programs for their students. While evaluation findings have consistently shown that the participants were highly satisfied with these service leadership education programs and they showed improvements in self-perceived service leadership attributes [18-20], the participants' actual gain in service leadership knowledge remains unknown.

Evaluation on Knowledge Gain and Service Leadership Knowledge Scale

Acquisition and application of leadership knowledge are among the desirable outcomes of leadership education [12, 17]. This learning outcome can be regarded as the foundation of service leadership education, which endeavors to promote a new leadership philosophy. To illustrate, without mastering service leadership knowledge, for example, what does service leadership emphasize and what qualities an effective service leader should develop, it is quite difficult, if not impossible, for the participants to adapt for the leadership beliefs and optimize their leadership practice. In this sense, it is indispensable to evaluate the participants' knowledge gained through a service leadership program so as to portray a full picture of the program effectiveness.

In leadership education, it is not uncommon to examine what the participants have learned from the program. However, due to the dearth of validated leadership knowledge scales, most studies examined self-perceived knowledge instead of objectively assessed knowledge. For instance, in an evaluation study conducted by Stedman, Rutherford, Rosser, and Elbert [21], the participants were asked to evaluate their own capacity in defining authentic leadership, character, relationship building stages, and other related knowledge points after a 5-day leadership conference. While measuring self-perceived knowledge seems to have advantages (e.g., easy and efficient), this approach has potential shortcomings. For example, the participants may overestimate their own knowledge level due to social desirability bias [22]. Besides, the trainees' self-ratings are likely to be affected by their subjective experience in the training. As argued by Sitzmann, Ely, Brown, and Bauer [23], "self-assessed knowledge is generally more useful as an indicator of how learners feel about a course than as an indicator of how much they learned from it" (p. 180).

Concerning these potential issues of measuring subjective leadership knowledge, it can be argued that a validated objective knowledge scale is a prerequisite for rigorously assessing

the participants' improvement of knowledge in a leadership program. Unfortunately, such objective leadership knowledge assessment tools are virtually non-existent in the Chinese communities. To fill this research gap as well as facilitating the evaluation of service leadership education in Hong Kong, we have developed a 200-item long-form Service Leadership Knowledge Scale (SLK-LF-200), which is able to assess individuals' actual understanding of service leadership. The scale primarily covered the knowledge points of the aforementioned Service Leadership Theory and associated publications of Chung, Shek and collaborators [e.g., 24, 25]. The details of the content of the SLK-LF-200 have been reported elsewhere [26].

The SLK-LF-200's content-validity and criterion-related validity were found to be good [26, 27]. More specifically, the criterion-related validation study compared an experimental group (i.e., 67 students who took the "Service Leadership" subject at PolyU) with a control group (i.e., 94 students who had never received any service leadership education) regarding their scores on the SLK-LF-200. In the study, 63 out of the initial 200 items were identified as being able to significantly differentiate the two groups [27]. A further item screening procedure was conducted and another 13 items were discarded concerning face validity or item duplication issues. As a result, a 50-item short-form Service Leadership Knowledge Scale (SLK-SF-50) was formed, constituting a fundamental assessment tool for evaluating service leadership education.

Norms and Correlates of the Knowledge Scale

While the content validity and criteria-related validity of the long-form Service Leadership Knowledge Scale (i.e., SLK-LF-200) have been supported, psychometric properties such as the convergent and divergent validity of the 50-item scale (i.e., SLK-SF-50) are unknown. Besides, the norms, as well as the potential correlates of the knowledge scale, are also important issues to be considered. As such, the eight UGC-funded universities in Hong Kong jointly organized a large-scale online survey to validate and finalize the service leadership assessment tools including the knowledge scale. Using the SLK-SF-50, the validation study yielded a final version of the Service Leadership Knowledge Scale which consists of 40 items (i.e., SLK-SF-40). While the procedure of obtaining the SLK-SF-40 as well as the scale's convergent and construct validity is reported in another article of this issue, the norms and the possible psychological correlates of university students' scores on SLK-SF-40 are the foci of the current chapter.

The norms of the service leadership knowledge are important because it serves as a benchmark to assist educators and researchers in developing, implementing, and evaluating effective service leadership programs for the purpose of helping students become knowledgeable service leaders. First, the established norms can be used to identify the standing of the target group's knowledge level in the normative population, based on which training needs can be determined and tailored training programs can be designed. Second, with the norms, participants' progress during training can be monitored by examining changes of their rank in the normative population. Likewise, the norms can be applied to evaluate the training effectiveness.

Normative data can be presented in terms of means and standard deviations of the raw score [28]. In using this type of normative data, one's standing on the assessment can be estimated through using a standardized score (i.e., *z* score), which can be further referred to a table of areas under the normal curve. While this method assumes normative data to be normally distributed, the reality is that normative data will often depart significantly from a normal distribution. Under this circumstance, an alternative, maybe a better choice is percentile norms, which may consist of a full presentation of the percentile rank for each raw score, or it may simply present some of the raw scores corresponding to several landmark percentiles (e.g., the 1st, 5th, 10th, 50th percentile etc.). Various examples of the use of percentile norms can be found in the extant literature [29-31].

Apart from its usefulness when normative data are not normally distributed, a further advantage of percentile norms is simplicity. While a standardized score needs to be interpreted by mapping it on to percentile rank through a look-up table developed by the researcher or an external conversion table [28], the percentile norms can tell us directly the relative position of an individual's test score in the normative population. Percentile norms are easy to understand even for lay people, as the meaning of percentiles is apparently unequivocal [32]. In view of the above positive features of percentile norms, the current study utilized this method to develop norms for the Service Leadership Knowledge Scale using university students in Hong Kong as the normative population.

To determine whether there is a need to develop separate norms for sub-groups, the present study considered two demographic characteristics: gender and age. For gender, in the previous studies, women were found to be more cooperative, relational, empathetic and caring as compared with men [33-37]. Possessing these characteristics which are related to service leadership qualities, women may be more aware of the demands of service leaders in today's service economy and have a better understanding of the philosophy and concepts of service leadership. Therefore, we expected that female students would have a higher level of service leadership knowledge as compared to male students (Hypothesis 1). For the influence of age, very little evidence can be identified in the existing literature. Besides, for the target population (i.e., university students) in the present study, variability in age is generally very small. Thus, we did not expect a significant influence of age on the participants' service leadership knowledge score.

The current study also considered the participants' academic achievement indexed by grade point average (i.e., GPA), the experience of receiving leadership training and experience of being a leader as another three potential correlates of service leadership knowledge score. A high GPA generally indicates an individual's success in course assignments thus could in part represent one's cognitive ability [38]. Based on the prior studies which consistently showed a positive relationship between leadership and intelligence observers including GPA [38, 39], we expected a positive association between GPA and service leadership knowledge (Hypothesis 2).

Although leadership training received by university students may not be directly related to the notion of service leadership, some overlapped knowledge points might be covered, such as the required leadership competency (e.g., problem solving and emotional competence). As a result, it is quite reasonable to expect that one's leadership training experience, regardless of its form and content, will be positively associated with one's service leadership knowledge score (Hypothesis 3). For student leadership experience, we argue that being a leader in a student organization will allow a student to understand what is demanded

by such a position and how he or she can better serve other students. Indeed, previous research found that years of being in a leadership role increased a leader's servant leader behaviors such as altruistic and empathetic behaviors [35]. As such, we hypothesized that the experience of being a leader would positively correlate with service leadership knowledge score as well (Hypothesis 4).

The Present Study

In March 2017, an online-survey project was initiated in the eight UGC-funded institutions in Hong Kong to validate measures assessing the qualities of service leaders as outlined by the Service Leadership Theory. The eight universities include The Hong Kong Polytechnic University (PolyU), The Chinese University of Hong Kong, The Education University of Hong Kong, Hong Kong Baptist University, City University of Hong Kong, Lingnan University, The University of Hong Kong, and Hong Kong University of Science and Technology. Ethics approval for the validation study was obtained from the Human Subjects Ethics Sub-committee of PolyU, which served as the lead institution of the project. The project aimed at validating three scales including knowledge, attitude, and behavior scales, among which the knowledge scale was the focus of the present study. Specifically, the present study outlined the norms and psychological correlates of the final version of the Service Leadership Knowledge Scale (i.e., SLK-SF-40).

OUR STUDY

The online survey was launched simultaneously in eight higher education institutions in Hong Kong. While the research team at PolyU prepared the questionnaire and set up the online survey, each participating university recruited their undergraduate students as participants by distributing the link of the online survey. The participants were well informed the principles of voluntary, anonymity, and freedom to withdraw from the study at any time. The students' consent was sought and each was given a supermarket voucher of 100 Hong Kong dollars as a token of appreciation upon completion of the survey.

Table 1. Demographic characteristics of the sample

University	1	2	3	4	5	6	7	8	Total
No. of participants	1,000	505	500	517	464	500	500	500	4,486
Percentage	22.29%	11.26%	11.15%	11.52%	10.34%	11.15%	11.15%	11.15%	100%
Age range	18-27	17-29	17-34	15-28	18-34	18-29	17-28	16-28	15-34
Age (Mean/SD)	20.46/1.65	20.08/1.55	21.05/1.75	20.79/1.67	20.63/1.77	20.54/1.55	20.38/1.67	19.85/1.50	20.47/1.67
Age group (15-19) (n/%)	297/29.70	193/38.22	95/19.00	117/22.63	112/24.14	133/26.60	173/34.60	224/44.80	1,344/29.96
Age group (≥ 20) (n/%)	703/70.30	312/61.78	405/81.00	400/77.37	352/75.86	367/73.40	327/65.40	276/55.2	3,142/70.04
Male students (n/%)	409/40.90	130/25.74	98/19.60	122/23.60	128/27.59	148/29.60	151/30.20	331/66.20	1,517/33.82
Female students (n/%)	591/59.10	375/74.26	402/80.40	395/76.40	336/72.41	352/70.40	349/69.80	169/33.80	2,969/66.18

The data collection lasted for approximately four months from March to June in 2017. Cases having at least one of the following issues were excluded from further analyses: 1) the participants did not provide consent as indicated by their selection of the option “I decline” on the consent form page, 2) the case was identified as repeated completion due to its same student ID as that of another case, and 3) the participants who claimed to be postgraduate students by themselves. After removing these invalid cases ($n = 69$), the final sample consisted of 4,486 participants, among whom 1,517 (33.82%) were male and 2,969 (66.18%) were female. The participating students’ age range was between 15 to 34 years ($M = 20.47$, $SD = 1.67$), with 1,344 (29.96%) aged between 15 to 19 years and 3,142 (70.04%) aged 20 years or above. Table 1 summarizes the demographic characteristics of the participants in each university based on age and gender.

Measures

The validation project included a wide array of measurements including the three service leadership scales, external criterion scales such as Moral Self Concept, demographic measures, and potential correlates. The present study focused on the Service Leadership Knowledge Scale, and its demographic and other potential correlates.

Service Leadership Knowledge Scale

The knowledge scale (i.e., SLK-SF-50) administrated in the present project consisted of 50 multiple-choice questions generated based on the Service Leadership Theory proposed by Chung [15]. The scale had a holistic coverage of the service leadership knowledge points pertaining to different domains such as the general description and the three realms of service leadership, service leadership competency, moral character, caring disposition, the core belief “everyone can be a leader,” and so on. Detail description of each knowledge domain has been reported elsewhere [26].

In the present study, 10 items in the SLK-SF-50 were discarded due to their low item-total correlations (i.e., below .30; see another chapter in this book). The retained 40 items formed the final scale (i.e., SLK-SF-40) which covered the same knowledge domains as did the original scale. The final scale possessed a one-factor structure with good overall goodness-of-fit indices (e.g., $\chi^2_{(740)} = 3,492.44$, $p < .001$; CFI = .98; TLI = .99; RMSEA = .03). The validation procedure and related validation indicators of the SLK-SF-40 are reported in another article in this issue. The present study was based on the final 40-item scale, which showed good internal reliability (i.e., Cronbach Alpha = .94). Each participant’s answer on each item was coded as “1” or “0” to indicate a correct or incorrect answer, respectively. A total score across the 40 items was computed as the service leadership knowledge score for each participant. In the present study, the participants’ knowledge score ranged from 2 to 40 ($M = 22.55$, $SD = 10.46$).

Demographic and Other Potential Correlates

The demographic characteristics concerned in the present study included age and gender. Other potential correlates included grade point average (i.e., GPA), the experience of leadership training and experience of being in a leadership role.

For GPA, while four participating universities adopted a system with 4.00 as the maximum score, other three universities had different maximum GPA scores (e.g., 4.5). Thus, for participants coming from these three universities, their raw GPA scores were converted to new scores using the formula: new GPA score = raw GPA score $\times$ 4/the maximum GPA score in the university. After this adjustment, the participants' GPA ranged between 0 and 4 ($M = 2.89$, $SD = .45$).

Furthermore, the participants reported whether they had ever taken any leadership course or training including that related to service leadership (0 = No, 1 = Yes), and whether they had served in any leadership position in an organization such as student association (0 = No, 1 = Yes).

Data Analyses

First, a multiple regression analysis was performed to examine whether gender (1 = Male, 2 = Female) and age significantly influenced participants' knowledge score. The results were used to decide whether there was a need to create separate norms for sub-groups. For example, if male students' knowledge scores significantly differ from that of their female counterparts, norms will be constructed separately for male and female students.

Second, we run normality tests to see whether knowledge scores are normally distributed. If the data are normally distributed, we will calculate standardized scores as well as percentile norms, and percentiles will be constructed only if the data are not normally distributed.

When constructing percentile norms, we first mapped raw scores to each percentile from 1 to 100. As several students gained the same knowledge score, one raw score can have several percentile rank scores, which may cause difficulties in interpreting the norms. Therefore, we further calculated a unique percentile for each raw score. As strongly recommend by Crawford et al. [28], we defined the unique percentile of raw scores as the percentage including those fall below as well as half of those obtaining the score of interest. This calculation method can be presented by the formula below:

$$\text{Percentile rank of a given raw score} = 100 \times (m + 0.5k)/N,$$

where m means the number of participants scoring below the given raw score, k is the number of participants obtaining the given score, and N represents the overall size of the normative sample considered. This method is adopted as it takes the discrepancy between a test score and the real-valued score into account [28]. After this calculation procedure, we further rounded off the figures to present the integer values.

Third, correlational analyses were utilized to investigate associations between other potential correlates (e.g., GPA and leadership training experience) and the participants' knowledge score.

OUR FINDINGS

While age did not show significant predicting effect on the knowledge score ($\beta = -.0003$, $p = .99$), gender significantly predicted the participants' knowledge score ($\beta = .17$, $p < .001$; Cohen's $f^2 = .03$), with female students ($M = 23.85$, $SD = 10.10$) having significantly higher

knowledge scores than male students ($M = 20.02$, $SD = 10.70$). Thus, Hypothesis 1 was supported.

Table 2. Percentiles and related raw scores for Service Leadership Knowledge Scale (SLK-SF-40) by gender

Percentile (1-50)	Raw Score			Percentile (51-99)	Raw Score		
	Male ($N = 1,517$)	Female ($N = 2,969$)	Total sample ($N = 4,486$)		Male ($N = 1,517$)	Female ($N = 2,969$)	Total sample ($N = 4,486$)
1	≤ 4.00	≤ 5.00	≤ 5.00	51	18.00	27.00	24.00

28	11.00	15.00	13.00	78	32.00	33.60	33.00
29	11.00	16.00	14.00	79	32.00	34.00	33.00
30	11.00	16.00	14.00	80	32.00	34.00	33.00
31	12.00	17.00	14.00	81	32.00	34.00	34.00
32	12.00	17.00	15.00	82	33.00	34.00	34.00
33	12.00	18.00	15.00	83	33.00	34.00	34.00
34	12.00	18.00	15.00	84	33.00	35.00	34.00
35	13.00	19.00	16.00	85	34.00	35.00	35.00
36	13.00	19.00	16.00	86	34.00	35.00	35.00
37	13.00	20.00	17.00	87	34.00	35.00	35.00
38	13.00	20.00	17.00	88	35.00	35.00	35.00
39	13.00	21.00	18.00	89	35.00	36.00	35.00
40	14.00	21.00	18.00	90	35.00	36.00	36.00
41	14.00	22.00	19.00	91	35.00	36.00	36.00
42	14.00	23.00	19.00	92	36.00	36.00	36.00
43	15.00	23.00	20.00	93	36.00	36.00	36.00
44	15.00	23.00	20.00	94	36.00	37.00	36.00
45	15.00	24.00	21.00	95	36.00	37.00	37.00
46	16.00	24.00	22.00	96	37.00	37.00	37.00
47	16.00	25.00	22.00	97	37.00	38.00	37.00
48	16.64	25.00	23.00	98	38.00	38.00	38.00
49	17.00	26.00	23.00	99	38.82	39.00	39.00
50	17.00	26.00	24.00	100	39.00	40.00	40.00

Then we performed normality tests for female and male groups separately. A Shapiro-Wilk’s test ($p < .001$) [40, 41] showed that the knowledge scores were not normally distributed for both males and females, with a skewness of .22 ($SE = .06$, $z\text{-value} = 3.67$, $p < .001$) and a kurtosis of -1.43 ($SE = .13$, $z\text{-value} = -11$, $p < .001$) for the male participants, and a skewness of $-.30$ ($SE = .04$, $z\text{-value} = -7.5$, $p < .001$) and a kurtosis of -1.31 ($SE = .09$, $z\text{-value} = -14.56$, $p < .001$) for the female group [42-44]. A further visual inspection of their histograms revealed a bimodal distribution for both groups. As such, only percentile norms were built separately for both male and female students. (see Table 2 and Table 3).

Table 3. Raw scores and related percentiles for Service Leadership Knowledge Scale (SLK-SF-40)

Raw score	Percentiles		
	Male ($N = 1,517$)	Female ($N = 2,969$)	Total sample ($N = 4,486$)
1	0.0	0.0	0.0
2	0.0	0.0	0.0
3	0.0	0.0	0.0
4	1.0	0.0	0.0
5	2.0	1.0	1.0
6	5.0	2.0	3.0
7	9.0	4.0	6.0
8	14.0	6.0	9.0
9	19.0	9.0	12.0
10	25.0	12.0	17.0
11	29.0	16.0	20.0
12	33.0	19.0	24.0
13	37.0	22.0	27.0
14	41.0	25.0	30.0
15	44.0	27.0	33.0
16	47.0	30.0	35.0
17	49.0	32.0	38.0
18	51.0	34.0	40.0
19	53.0	36.0	41.0
20	55.0	37.0	43.0
21	56.0	39.0	45.0
22	57.0	41.0	47.0
23	59.0	43.0	48.0
24	60.0	45.0	50.0
25	62.0	48.0	52.0
26	64.0	50.0	54.0
27	66.0	52.0	57.0

29	70.0	58.0	62.0
30	73.0	62.0	66.0
31	76.0	66.0	70.0
32	80.0	71.0	74.0
33	83.0	76.0	78.0
34	86.0	81.0	83.0
35	90.0	86.0	87.0
36	94.0	91.0	92.0
37	97.0	95.0	96.0
38	98.0	98.0	98.0
39	100.0	99.0	99.0
40	100.0	100.0	100.0

Correlates of Knowledge Score

Results of correlational analysis showed that the participants' service leadership score was significantly correlated with their GPA ($r = .20, p < .001; r^2 = .04$), experience of taking leadership course or training ($r = .07, p < .001; r^2 = .005$), and experience of being a leader ($r = .12, p < .001; r^2 = .014$), meaning that students with higher GPA, having experience of taking leadership course or training, or having experience of being a leader before were likely to have a better understanding of service leadership knowledge. Hence, Hypotheses 2 to 4 were also supported. However, it is noteworthy that the effect size involved was small.

DISCUSSION

The present study outlined percentile norms and potential psychological correlates of the Service Leadership Knowledge Scale (SLK-SF-40). As a pioneering attempt to develop and validate objective knowledge scale pertinent to service leadership, the present study is a timely response to the lack of assessment tools measuring individuals' leadership knowledge in the Chinese context. Concerning the fact that substantial effort has been taken on promoting service leadership education in Hong Kong while little research has articulated the effectiveness, the present study also makes an important progress in addressing the issue of evaluation. In particular, the established norms will serve as a useful instrument not only to assess individuals' standing in a normative population regarding the fundamental knowledge of service leadership but also to track the improvement of the participants' relative standing during and after receiving service leadership education.

Noteworthy, the current study has two methodological strengths. First, we developed the norms based on a large and representative sample of university students coming from multiple higher education institutions in Hong Kong. Therefore, we believe that the generalizability of the findings is good. Second, we used an objective knowledge scale where the items were derived from a solid leadership framework. In addition, the validity and other psychometric properties of the scale have been proved to be good. Thus, the norms can be regarded as reliable and valid in delineating university students' service leadership knowledge level.

Apart from the norms, our study adds to the extant literature on the potential correlates of university students' comprehension of service leadership. Three notable observations from the present findings could be highlighted. First, as expected, the university students' service leadership knowledge scores were not significantly associated with their age. This result indicates that the students will not gain a better understanding of the service leadership concepts automatically as time goes by. Instead, leadership training could be an effective means for knowledge acquisition. Indeed, previous studies suggest that leadership development among youth is closely related to their involvement in leadership training programs [45, 46]. The present study also found that overall leadership training experience was positively correlated to service leadership knowledge score, supporting the utility of conducting leadership training for youth. Nevertheless, the effect size of the correlation between leadership training experience and service leadership knowledge was not large. This may be because we did not specify the focus of leadership training. Although leadership

training programs, regardless of their focus, may cover some common knowledge points which are also useful for increasing the understanding of service leadership, those training programs specifically focusing on service leadership may be more effective.

Second, also in line with our hypothesis, the female students demonstrated a higher knowledge level than did the male students. This is understandable because women are more service-oriented than men in nature, as evidenced by research findings showing that women tended to be more caring, relationship-oriented and empathetic than men [34-36]. These qualities fit the demands of the service economy at the first place and help women better understand the service leadership concepts than men. Given this gender difference, two separate norms were established for female and male students. One practical implication of this finding is that gender effect should be considered when implementing and evaluating service leadership education programs.

Third, the participants' GPA was positively correlated with their service leadership knowledge score. For GPA, a better score usually indicates a student's better cognitive ability such as reasoning and problem solving skills [38], which may better enable them to infer what kind of leadership qualities can fulfill the needs of service economy. Fourth, we found that the experience of being a leader in a student organization was associated with a higher service leadership knowledge score. This result also echoes the previous findings which suggested that serving in leadership roles in university exerts positive impacts on diverse student learning outcomes such as leadership efficacy [47]. It is believed that student leadership in college embody a wide range of elements such as helping people, building relationship and working as a team [48], all of which are related to service leadership concepts, directly or indirectly.

Although the present study represents a pioneering effort to construct percentile norms and identify potential psychological correlates for service leadership knowledge, it has three limitations. First, we only investigated university students which may limit the generalizability of the findings to other populations. Future research will certainly benefit from employing a more heterogeneous sample of potential service leaders including employees in different economic sectors and constructing norms of service leadership knowledge accordingly. Second, we did not collect data in other Chinese communities. As service economy grows rapidly as well in mainland China where there is also a need to launch service leadership education programs, it is also necessary to build norms among mainland Chinese people for evaluation purpose. Thus, future research could go further by collecting data and comparing knowledge levels in different Chinese communities. The final limitation is related to the limited number of potential correlates considered in the present study. For example, we did not examine the influence of students' undergraduate major. As some of the knowledge points are not unique to service leadership, it is thus possible that students in certain majors can learn the knowledge from their own major subjects such as social work or psychology. Future studies could include students' major and other individual traits such as personality to examine and compare the relationships between these factors and service leadership knowledge level.

ABSTRACT

As there are few validated measures of service leadership in the Chinese contexts, there is a need to develop and validate scientific instruments to assess service leadership attitudes and beliefs of Hong Kong university students. In this chapter, we present normative findings for the 46-item Service Leadership Attitude Scale (SLA-SF-46) and explore the potential personal correlates in a large university sample (N = 4,486) recruited from eight universities in Hong Kong. Results showed that while female

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

students scored significantly higher on the SLA-SF-46 compared to male students, no age-related differences were observed. Hence, separate norm tables for both gender groups were constructed. With regard to the potential personal correlates, students' grade point average (GPA), previous leadership training, and experiences of being a leader were all positively correlated with their SLA-SF-46 scores, although the effect sizes were not large. The creation of the percentile norms helps educators and practitioners to understand the service leadership attributes of individuals.

INTRODUCTION

Hong Kong has experienced a drastic reform of the economic system from an industrial era to a post-industrial era since the 1970s. The service sector, represented by traditional key industrials (such as trading, tourism, and financial services) and emerging industries (such as medical services, education services, and creative industries), has replaced manufacturing and become the engine of economic development in Hong Kong. The core assets of the modern society are intangible human capitals (e.g., knowledge, intelligence, and skills) beyond tangible physical assets (e.g., the real estate or the machinery). Leadership, as a core determinant for the operation of contemporary business enterprises, has different meanings in every era and every society [1]. For the traditional manufacturing economy, top-down and bureaucratic paradigms of leadership models are notably effective as they are product-oriented and task-focused. However, those paradigms are no longer well suited for the modern service-oriented and knowledge-based economy [2]. As commented by Manville and Ober in the "Harvard Business Review," "we're in a knowledge economy, but our managerial and governance systems are stuck in the Industrial Era. It's time for a whole new model" [3]. Unfortunately, we find very few explicit discussions of leadership models for the knowledge era with regard to Hong Kong. Against this background, Chung [4] advocated the notion of service leadership and refined the idea with the Service Leadership and Management (SLAM) model. According to him, service leadership "is about satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" [4].

Classic leadership models proposed that leaders shall possess specific genetic traits, which was much based on the belief that leaders are born and not made [5]. In contrast, service leadership theory begins with the basic assumption that leadership could be learned and everyone can be a leader [6]. Therefore, the call for leadership is for everyone. Particularly, for students in tertiary institutions, leadership development is viewed as one of the most prominent themes and objectives as they will become pillars of the society in the foreseeable future [7]. Although there are leadership courses and programs targeting young people, several limitations merit attention. First, most of the existing leadership development programs in the business world are usually expensive and still aim for "elitists" solely [8]. Second, only "hard" skills (such as knowledge and management skills) of a leader are emphasized in most leadership development programs [9], whereas "soft" skills (such as interpersonal and intrapersonal competences) are overlooked. Third, there is a lack of systematic evaluation of leadership training programs [9].

Service Leadership Education in Hong Kong

Effective leadership courses or programs designed for university students are rare in Hong Kong. As such, with the theoretical groundwork of the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) and financial support of the Victor and William Fung Foundation, the Fung Service Leadership Initiative was launched in 2012 and a series of service leadership projects were subsequently conducted in eight institutions that funded by the University Grants Committee (UGC). These projects included both credit-bearing subjects and non-credit bearing programs aiming to nurture leaders with the fundamental service leadership qualities, including competences, characters, and caring dispositions [4]. To date, findings from many evaluation studies suggested that service leadership training had received favorable responses from different stakeholders. Taking The Hong Kong Polytechnic University (PolyU) as an example, participants indicated their satisfaction with the service leadership programs and showed great improvements in service leadership attributes (such as intrapersonal competences) based on multiple evaluation strategies [10-12].

One important dimension of leadership training is leadership attitudes and beliefs such as whether a leader believes the followers are changeable. It is not rare to measure leadership attitudes and beliefs with respect to a particular leadership model. For instance, Fleishman [13] developed the Leadership Opinion Questionnaire (LOQ) to assess leadership attitudes in the industry setting from the perspective of the Leadership Skills Model that mainly focused on the competences of leaders, such as problem-solving skills and social judgment skills. Wielkiewicz [14] also developed a Leadership Attitudes and Beliefs Scale (LABS) based on the assumption that leadership could be understood through organizational success rather than individual actions. Unfortunately, none of the extant leadership attitude scales is suitable for examining individuals' understanding of the service leadership theory. In contrast to these existing theories, Service Leadership theory adopts a more systematic and comprehensive approach. As service leadership training programs have been designed and organized in different institutions, it is imperative for researchers and educators to have a standardized tool assessing service leadership attitude.

Under this premise, the Research Team at PolyU endeavored to develop and validate scales on service leadership knowledge, attitude, and behavior. With regard to the Service Leadership Attitude Scale (SLA), a 132-item long form (i.e., SLA-LF-132), was initially developed on the grounds of the SLAM framework [4] with relevant publications authored by Chung, Shek, and collaborators [15-17]. The previous study demonstrated that SLA-LF-132 had good content validity [18]. Results of an initial exploratory factor analysis (EFA) based on 200 sets of questionnaires suggested a 5-factor solution with 73 items (i.e., SLA-SF-73), which showed good reliability and significant correlation with the 50-item short-form Service Leadership Knowledge Scale (i.e., SLK-SF-50). Based on the SLA-SF-73, further EFA and confirmatory factor analysis (CFA) based on larger samples ($N = 2,246$ and $2,240$, respectively) informed a finalized solution with 46 items (i.e., SLA-SF-46), which demonstrated good fit indices ($CFI = 0.93$; $NNFI = 0.92$; $RMSEA = 0.041$). Results showed that the SLA-SF-46 covered dimensions of vision and competence, people orientation, caring disposition, ethical role model, social competence, self-understanding and reflection, positive view about human beings, and unchangeable and dark human nature. The findings are reported in a chapter in this book. In the current study, all the results were based on the final version Service Leadership Attitude Scale (i.e., SLA-SF-46).

Normative Data for the Service Leadership Attitude Scale

Normative data for the Service Leadership Attitude Scale is fundamental to the development and implementation of the service leadership education. The use of normative data is common in psychological assessment. In the field of leadership study, there has been relatively little research concerning the norms of leadership [19], not to mention in different Chinese contexts. Accordingly, the development of normative data for SLA-SF-46 is an important addition to the literature. First, normative data provides a yardstick to measure, rank, and compare individuals' level of service leadership attitudes and beliefs. Second, with the help of normative data, educators could detect students' current beliefs and blind spots on service leadership. Then targeted curriculum and teaching could be offered and developed. Third, a straightforward and convenient norm table provides a very useful research tool that could objectively assess program effectiveness.

The Literature on normative data suggested different ways of explaining the means and standard deviations of raw scores [20]. For normative distributions, standardized Z scores could be calculated for estimation. The normal curve could indicate the corresponding area with the given Z score. However, the distributions in real life are usually non-normal. In such situations, another alternative but complementary approach to describe normative data is percentile norms [21], which provides a full and concise picture of the correspondence between a raw score and its percentile rank. Furthermore, percentile norm is convenient to use, even for non-professionals. As such, the overarching objective of this chapter was to provide the estimates of percentile ranks corresponding to raw scores on the SLA-SF-46.

Personal Correlates of Service Leadership Attitude

For sub-groups of a population, separate norms would be needed if they demonstrate notable differences. Gender and age were the principal demographic factors covered in the current study. Societies always have discrepant gender role expectations, which influence individuals' leadership attitudes and beliefs. Across cultures, females are still underrepresented in leadership positions in comparison to males [22]. In previous literature, there was an incongruity in the association of gender and leadership attitude. According to Wielkiewicz et al. [23], a greater percentage of male first-year college students was located in the Low Hierarchical/Low Systemic category of leadership beliefs, which was associated with effective ecological leadership. Based on this finding, it was hypothesized that male college students in Hong Kong would possess a higher level of service leadership attitude than female college students (Hypothesis 1a). Nevertheless, multiple empirical studies demonstrated that women leaders were better at emotional balance and control, more expressive, and cooperative than men [24, 25]. Hence, it could also be assumed that female college students in Hong Kong would possess a higher level of service leadership attitude compared with male college students (Hypothesis 1b). The primary goal of this study was to test these two competing hypotheses, and preliminarily explore the gender differences issue in service leadership.

Although a body of research has tried to shed light on the age-related differences in leadership over the last decades, there is no solid conclusion [26]. Existing findings on age-

leadership linkages are scarce and contradictory. For example, Barbuto et al. [27] found that age positively predicted transformational leadership and individualized consideration. Other studies, in contrast, observed that older leaders demonstrated less mastery of teamwork knowledge [28], less delegating and considerate behaviors [29]. Besides, other studies have reported non-significant relationships between leaders' age and their task-oriented behaviors [27, 30] or leadership styles [31]. Considering the inconclusive findings of the relationship between age and leadership, and the narrow span in age for the targeted population (i.e., university students), we did not put up any specific hypothesis on the relationship between age and service leadership attitude.

Other personal factors were assumed to be associated with service leadership attitude in the current study, which included participants' grade point average (i.e., GPA), their leadership training experience, and the previous experience of being a leader. GPA has been regarded as a good predictor of the performance of solving complex tasks, which was closely associated with favorable leadership attributes [32]. Besides, studies have observed that university students' GPA was positively correlated with their life-long learning attitude, self-rated leadership abilities, and disagreement with hierarchical leadership thinking [33]. Therefore, the current study attempted to examine this GPA-leadership linkage and expected a positive correlation between participants' GPA and service leadership attitude (Hypothesis 2).

Multifarious leadership training programs in and out of campus are not uncommon for university students. Empirical studies have investigated the benefits of such education efforts. According to a longitudinal study that assessed the outcomes of 31 leadership development programs in ten institutions in the United States [34], participation in leadership programs had a positive impact on college students' personal development, multi-cultural awareness, and values understanding ability. Although the philosophy and concepts of other leadership programs would not perfectly match service leadership theory, some could share the similar attitudes or beliefs. As inspired by previous studies, it was expected that one's leadership training experiences would be positively related to the service leadership attitude (Hypothesis 3).

Apart from the leadership training experiences, college students nowadays have abundant opportunities to serve as a leader. Qualitative findings showed that college students' practices in leadership roles brought about positive experiences in the aspects of skills-building and interacting personality [35]. Accordingly, it was expected that being a leader previously would be positively associated with service leadership attitude (Hypothesis 4).

OUR RESEARCH

An online survey was adopted in the present study. A total of 4,555 university students were recruited using snowball sampling from the eight UGC-funded universities in Hong Kong, including The Hong Kong Polytechnic University (PolyU), The University of Hong Kong (HKU), The Chinese University of Hong Kong (CUHK), Hong Kong Baptist University (HKBU), City University of Hong Kong (CityU), The Education University of Hong Kong (EdUHK), Lingnan University (LU), and Hong Kong University of Science and Technology (HKUST). Each institution recruited at least 500 full-time undergraduate students

to complete the survey via the PolyU “mySurvey” online survey platform (<https://www.polyu.edu.hk/mysurvey/>).

Table 1. Socio-demographic profiles of participants (N = 4486)

	N (%)
Gender	
Male	1,517 (33.82%)
Female	2,969 (66.18%)
Age	
15-19 years	1,344 (29.96%)
20-24 years	3,070 (68.44%)
25-29 years	69 (1.54%)
30 years or above	3 (0.07%)
University	
PolyU	1,000 (22.29%)
CUHK	505 (11.26%)
EdUHK	500 (11.15%)
HKBU	517 (11.52%)
CityU	464 (10.34%)
LU	500 (11.15%)
HKU	500 (11.15%)
HKUST	500 (11.15%)

Note. PolyU = The Hong Kong Polytechnic University; CUHK = The Chinese University of Hong Kong; EdUHK = The Education University of Hong Kong; HKBU = Hong Kong Baptist University; CityU = City University of Hong Kong; LU = Lingnan University; HKU = The University of Hong Kong; HKUST = Hong Kong University of Science and Technology.

Website link of the survey was provided for interested participants, where they were able to electronically sign a consent form before the survey started. Students were informed about the confidentiality of their responses and the rights to withdraw from this study at any time. Each participant would be given \$HK100 as a token of appreciation upon completion of the survey. The online survey hosted at each university with links between March to June 2017. Among all the 4,555 respondents, six students were excluded as they declined to complete the questionnaire. In the next step, thirty-three cases who completed the questionnaire for multiple times were also removed. Other thirty more cases were deleted due to the ineligibility of participants (e.g., mismatching in the institution and the questionnaire version, as well as those postgraduate students who accidentally completed the questionnaire). In the end, the sample of this study consisted of 4,486 university students between the age of 15 and 34 years ($M_{age} = 20.47$, $SD_{age} = 1.67$), including 1,517 (33.82%) males and 2,969 (66.18%) females. Table 1 summarizes the socio-demographic characteristics of the participants.

Instruments

The online survey consisted of demographics, the composite Service Leadership Scale, and several well-validated leadership or personality measurements (e.g., Leadership Efficacy Scale; Interpersonal Reactivity Index) [36-38] serving as external criteria. The composite Service Leadership Scales measured Service Leadership Attitude, Service Leadership

Knowledge, and Service Leadership Behavior. This chapter only focused on Service Leadership Attitude Scale and its potential personal correlates.

Service Leadership Attitude Scale

The 46-item final version SLA-SF-46 was developed and validated by the first author of the current study [18] on the basis of the SLAM framework and relevant literature on service leadership theory [9, 39]. Details for the scale validation procedure shall be documented in another article in this book.

The scale aims to assess individuals' views and beliefs about the role of leader or desirable leadership practices/qualities. Scores for each item range from 1 (very dissimilar to me) to 6 (very similar to me). Eight subscales are incorporated in the SLA-SF-46, including vision and competence (10 items), people orientation (8 items), caring disposition (7 items), ethical role model (5 items), social competence (4 items), self-understanding and reflection (5 items), positive view about human beings (2 items), and unchangeable and dark human nature (5 items). A raw score of SLA is yielded by summing scores of all 46 items. The SLA-SF-46 was found to be internally consistent in this study ($\alpha = .94$ for the full scale; $\alpha = .70$ to $.90$ for all subscales).

Personal Correlates

The demographic profile in the survey covered participants' age ($M_{\text{age}} = 20.47$, $SD = 1.67$) and gender (0 = Female, 1 = Male). Other potential correlates concerned their learning experiences in leadership-related courses/programs, leadership experience, and grade point average (GPA) in University. Specifically, participating students reported whether they had ever taken any leadership (including but not limited to service leadership) course or program (0 = No, 1 = Yes), whether they had ever served in any leadership position in an organization (0 = No, 1 = Yes), and their recent GPA (ranged between 0 and 4 after standardization).

Data Analyses

All statistical analyses were performed using SPSS for Windows, version 23.0 (IBM-SPSS Inc, Chicago, Illinois, USA). First of all, to decide if there was a need to create separate SLA-SF-46 norms for different sub-groups, differences originated from gender and age were firstly assessed utilizing a multiple regression analysis.

Before creating the percentile norms, we ran normality tests to make sure whether SLA-SF-46 total scores were normally distributed or not. If the test scores of the sample are normally distributed, the raw scores should be standardized to Z scores based on the means and SDs. Then a parametric method [40] could be adopted to provide an interval estimate of the percentile rank. If not normally distributed, the interval cannot be estimated and only the percentiles for raw scores would be constructed.

To sketch the percentile norms, we listed all raw scores to each percentile from 1 to 100. Because of the granularity of raw scores, a given raw score could match more than one percentile. As suggested in the article of Crawford, Garthwaite, and Slick [20], in such situations, if the number of test items is modest, the user would be suggested to calculate the unique percentile rank for each raw score based on the standard formula [41]: *Percentile Rank*

$= (m + 0.5k)/N \times 100$. Among which, m stands for the number of individuals who scored lower than that specific raw score, k means the number of individuals who scored that specific raw score, while N indicates the total number of the norm sample. The calculated percentile ranks were then rounded to integers from 1st to 99th percentiles.

Last, correlational analyses were carried out to assess other potential correlates (i.e., training experience in leadership courses/programs; experiences of being a leader; and GPA).

FINDINGS

Multiple regression analysis (Cohen's $f^2 = .02$) showed that age did not significantly contribute to the variances of participants' SLA-SF-46 score ($\beta = -.01$, $p = .41$). Generally speaking, gender significantly predicted participants' SLA-SF-46 score ($\beta = -.14$, $p < .001$), with higher SLA-SF-46 total scores for female students ($M = 217.29$, $SD = 19.49$) compared with male students ($M = 210.79$, $SD = 24.07$). Univariate analysis showed gender differences for all dimensions of SLA, with female students obtaining higher scores than male students ($F = 14.60 \sim 96.39$, $ps < .001$, $\eta^2 = .005 \sim .021$). Therefore, Hypothesis 1b was supported while Hypothesis 1a rejected. Separate norm tables were subsequently created for different genders.

The normality tests showed that the SLA-SF-46 scores for both female and male groups were negatively skewed with a skewness of $-.67$ for females and -1.07 for males, and a kurtosis of 3.58 for females and 3.90 for males. Kolmogorov-Smirnov tests confirmed that the distributions deviated highly significantly from a normal distribution ($D = .071$ and $.076$ respectively for female and male groups, $ps < .001$). Hence, percentiles for raw scores, instead of standardized Z scores, were calculated due to the non-normalized distributions. The tabulation method was adopted to display the corresponding raw score for each percentile rank (Table 2). Meanwhile, another lookup table demonstrated the corresponding percentile for each raw score (Table 3). The normative data were stratified by gender as gender influenced SLA-SF-46 scores appreciably.

Correlational analyses showed that the participants' SLA-SF-46 scores were significantly correlated with their leadership training experience ($r = .09$, $p < .001$; $r^2 = .008$), leadership position experience ($r = .09$, $p < .001$; $r^2 = .008$), and GPA ($r = .15$, $p < .001$; $r^2 = .02$). As such, Hypotheses 2 to 4 were all supported. However, the findings should be interpreted with caution, as the effect sizes were limited.

DISCUSSION

To address the issue of evaluation and assess objective changes in attitudes and beliefs in Service Leadership education program, a validated measurement is indispensable. To fill this gap, the current study presents findings on the percentile norms and personal correlates of the Service Leadership Attitude Scale with a large university sample ($N = 4,486$) in a Chinese context. The constructed norms shall serve as a reference to rank and compare individuals' service leadership attitude among a particular population, as well as a useful resource for educators and practitioners to detect the changes before and after receiving service leadership courses or programs.

Table 2. Percentiles and related raw scores for Service Leadership Attitude Scale (SLA-SF-46) by gender

Percentile (1-50)	Raw Score				Percentile (51-99)	Raw Score		
	Male (N = 1,517)	Female (N = 2,969)	Total sample (N = 4,486)			Male (N = 1,517)	Female (N = 2,969)	Total sample (N = 4,486)

The present study contributes to the future service leadership research and practices in two ways. First, a multi-institutional sample of Hong Kong university students helps to develop the normative profile, which can assist the interpretations of the raw scores. Second, the scale that originated from the SLAM framework provides some insight into the content of the service leadership theory.

Beyond the norms, the examination of individual differences and potential personal correlates broadens researchers and educational practitioners' understanding of university students' attitudes and beliefs towards service leadership. First, the current study revealed that female college students in Hong Kong possessed a higher level of service leadership attitude compared with male students. Although leadership has been traditionally viewed as a masculine activity [42], some studies have identified females' strengths being as leaders [23-25]. One factor that contributes to gender differences in service leadership attitude owes to the features of service leaders. A service-oriented economy requires service leaders to be

caring and interpersonal-oriented, which have been viewed as the unique features of femininity.

Second, no age-related difference was observed in the service leadership attitude, echoing prior scholars' arguments that non-significant relationship exists between leaders' age and their leadership behaviors [27, 30]. Meanwhile, leadership training experiences turned out to be positively associated with the service leadership attitude in the current study. The findings imply the importance of service leadership education that one's service leadership attitudes and beliefs could be acquired through training and learning.

Third, participants' service leadership attitude scores were positively associated with their GPA, leadership training experiences, and the experience of being a leader. These findings can be attributed to the fact that students with higher GPA usually perform better in solving cognitively complex tasks [32], which may promote their understanding of service leadership attitude. On the other hand, experiences of receiving leadership training and opportunities being a leader were believed to positively impact university students' service leadership attitude. It is consistent with previous studies [43] that student leadership in universities creates positive impacts on building their skills and characters.

Although our study is pioneering in the field of leadership, it is not without limitations. First, the sample recruited in the current study was limited to Hong Kong university students. Hence, it restricts the generalizability of the findings to other populations or the same population in other regions. To follow up the pioneering work of this study, future research shall employ other heterogeneous populations to create corresponding norm tables, as well as test the possible personal correlates. To this end, the service leadership theory should be tested in various professions and industries. The second limitation pertains to the investigation of possible personal correlates. On the one hand, although the correlations were significant, the effect sizes were not large. A possible explanation for this might be the undetected intermediate effects, which should be further explored in the future. Hence, future studies should take possible correlates, such as students' majors and personalities, into account. Despite these limitations, this study constitutes a good progress for the area of service leadership measurement.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

The shift from industrial society to service society calls for effective service leaders who can unite and motive people to work together effectively. However, valid scales assessing important leadership qualities required by service economy are rare. To fill this gap, three scales were developed based on the Service Leadership Theory to measure leadership qualities. In this chapter we present findings on the norms and personal correlates of the Service Leadership Behavior Scale using data collected from an online questionnaire administered to 4,486 students from eight University Grants Committee (UGC) funded universities in Hong Kong. As significant gender differences were found, two norms were developed separately for female and male participants. No significant influence of age on leadership behaviors was noted. For other personal correlates, students' grade point average (GPA), experience in leadership training, and experience of

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

being a leader were associated with the leadership behavior scores, though the effect size was small. Limitations and implications of the present findings are discussed.

INTRODUCTION

The economic growth in the twenty-first century is shown by the transition from the manufacturing economy into service economy [1]. This transition, characterized by the provision of service rather than goods, has transformed global economies on a massive scale. As service is essentially delivered through people to people, strong service leadership that helps people work together effectively has become the key to organization success.

The era of service economy calls for effective leaders. Growing leadership training programs in higher education sectors have been developed to improve university students' leadership qualities, which can better prepare them for the challenges in the service economy. For example, supported by the Victor and William Fung Foundation, a leadership program entitled "Fung Service Leadership Initiative" was developed and launched in eight public universities funded by the University Grants Committee (UGC) in Hong Kong, aiming at nurturing students' development in leadership knowledge, attitude and behavior [2].

To improve program effectiveness, objective outcome evaluation is essential as it provides evidence of the program's contribution to students' leadership development and the knowledge base. However, scales specifically designed to measure leadership qualities required by service economy are rare. In the following sections, the "Fung Service Leadership Initiative" in Hong Kong and the development of the Service Leadership Behavior Scale are described.

Service Leadership Education and Evaluation in Hong Kong

The economy of Hong Kong is very service-oriented [3]. The share of the service sector has almost reached 93% of the Gross Domestic Product (GDP) in Hong Kong in 2007, and remained around that level in the recent decade [4]. Chung has thoroughly discussed the contemporary service society in Hong Kong and proposed the Service Leadership Theory [5–7]. According to Chung [8], service leadership is to "satisfy needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments". Service Leadership Theory highlights three essential qualities underlying effective service leadership, which include competence, character and care. All of these three qualities are indispensable to effective leadership. In other words, a lack of any of three fundamental characteristics may lead to ineffectiveness, dysfunction, and even the dark side of leadership [9].

The Service Leadership Theory serves as the cornerstone of the leadership education program of eight UGC-funded universities in Hong Kong. Supported by the Victor and William Fung Foundation, these universities have developed service leadership education programs to enrich students' knowledge about service leadership, shaping their attitude of being service leaders, and improving their leadership behavior in practice [2]. For example, in The Hong Kong Polytechnic University (PolyU), education programs have been provided in

different forms, including credit-bearing and non-credit-bearing courses, as well as short-term workshops [10]. These programs have been carefully designed to help students improve the three fundamental service leadership qualities, namely competence, character and care. Previous studies have showed that students reported a high level of satisfaction towards the programs, and the programs were perceived to be effective [11–13].

Development of the Service Leadership Behavior Scale (SLBS)

Many leadership theories have focused on behavior of leaders [14]. A number of leadership models have been developed in the postindustrial era to understand the role of leadership behavior in employees' engagement and organization effectiveness [15]. Recent leadership literature has increasingly moved the focus from highlighting leaders' competences (e.g., charismatic leadership) towards an emphasis on shared, ethical, people-centered leadership styles (e.g., servant leadership and ethical leadership) [16, 17]. For example, servant leadership highlights the personal growth of followers [16]. Ethical leadership focus on normatively appropriate conduct demonstrated by leaders [17].

The above-mentioned models capture many key elements of leadership skills and behaviors, but are not sufficient to measure service leadership behavior in specific cultural contexts. First, most models solely measure leadership competences, and only a few theories specifically focus on leaders' character and care. However, almost none of these theories has considered competence, character and care three indispensable elements of effective service leadership [18]. In other words, a model integrating these three leadership qualities required by service economy is missing. Second, though it is widely agreed that culture and local contexts are important leadership research, assessment tools of leadership behavior seldom take cultural contexts into accounts. As Tsui advocated, to develop contextual measurement to deepen leadership research in China is "not only desirable, but essential" [19].

To fill the above gaps, the research team at The Hong Kong Polytechnic University (PolyU) designed a long-form Service Leadership Behavior Scale (SLB-LF-97) guided by the Service Leadership Theory. The SLB-LF-97 contains 97 items, aiming to measure the behavioral characteristics of a service leader [20]. The initial validation of SLB-LF-97 was conducted in a study involving 231 PolyU undergraduate students as part of the "Development and validation of measures based on the Service Leadership Model" project. The reliability of the SLB-LF-97 was excellent ($\alpha = 0.97$). Exploratory factor analysis (EFA) suggested the removal of 32 items with multiple or low loadings. A short-form of the Service Leadership Behavior Scale (SLB-SF-65) containing 65 items was formed. The results of the initial validation of the SLB-LF-97 were reported in another article prepared by Shek, Ma and Lin in this book. Generally speaking, the refined scale (i.e., SLB-SF-65) reflected good internal consistency and convergent validity. The SLB-SF-65 was further validated in a large-scale project, which resulted in the final version of the scale including 38 items (SLB-SF-38). Details can be seen in another chapter prepared by Shek and Ma in this book as well as in the User Manual.

Norms and Correlates of the Service Leadership Behavior Scale

The present study aims to provide norm data of the Service Leadership Behavior Scale to better interpret students' leadership behavior scores. Besides, potential personal correlates between gender, age, academic achievement, experience in leadership training, experience of being a leader and students' service leadership behavior scores were examined.

Norm data of a scale provide the necessary frame of reference to aid test administrators, educators and researchers to interpret the scores of individuals. For the test data that are normally distributed, standardized scores are commonly used to represent an individual's performance level [21]. For the non-normative sample, however, percentile rank is often used as an alternative option. Compared with standardized score, percentile rank provides the ranking position of individual's score among the population, and directly shows the intrinsic meaning which the standardized scores do not [22]. The norms can consist the tables including all percentile ranks for each raw score, or only including some landmark percentiles and the corresponding raw scores [22]. The norms are useful source that helps improve the effectiveness of leadership educational programs. On one hand, identifying the benchmarks of behavior performance for different populations helps better design these programs for populations with specific needs. On the other hand, change in percentile rank for an individual can be tracked, implying that the effectiveness of the leadership program at the individual level can be evaluated.

As the norm data may differ among populations, gender and age are two important demographic characteristics that were taken into account in the present study. Several reviews have thoroughly discussed gender difference in leadership styles and behaviors [23-25]. For example, Mandell and Pherwani [24] examined gender difference in emotional intelligence and transformational leadership style. The results suggested that female leaders managed their own and others' emotions better than their counterparts did. In addition, using 40 data sets drawn from 28 studies in research of gender and instructional leadership, Hallinger and his colleagues [23] concluded that compared with male principals, female principals tended to engage in more active instructional leadership. However, gender difference in leadership behavior remains inconclusive. For example, Oshabemi and Gill [25] collected data from leaders in UK and found no significant gender difference in leadership styles.

Despite the different results drawn from statistical comparison, many studies have suggested that female leadership are often characterized by strong interactive, transformational and cooperative management. Rosener [26] pointed out that women tend to adopt a transformational style through providing care to others. This argument was supported by Carless [27], who argued that women were naturally socialized towards skills in participative leadership, collaborative group management, and quality interpersonal relations. Therefore, in the present study, we hypothesized that female participants' service leadership behavior scores would be higher than those of male participants (Hypothesis 1). As to age, some studies have suggested that the elder leaders may present stronger leadership as both their leadership experience and social relationship would be developed as time goes on [28], but the associations were often found to be weak [29]. In addition, given that the participants were all university students in this study, the variation in age was small. Therefore, we included age as a demographic characteristic in the analysis, but did not anticipate that age would significantly influence service leadership behavior scores.

The present study also took participants' academic achievement, experience of receiving leadership training and experience of being a leader into account. Grade Point Average (GPA) has been commonly used to define participants' academic achievement. Though the direct relationship between university students' GPA and their leadership remains unclear [30], many studies have revealed that GPA is closely related to some important abilities that can strongly predict leadership. For example, Kellett, Humphrey and Sleeth [31] found that GPA was a strong predictor to complex task choice, and these two factors showed a combined positive influence on leadership perceptions. In addition, studies in the Chinese context also observed similar correlations [32]. As such, we hypothesized that there would be a positive correlation between GPA and leadership behavior scores (Hypothesis 2).

As to the potential correlation between leadership training experience and behavior, research has highlighted the benefits of service and experiential learning to students' leadership development [33]. Many leadership programs often provide a variety of activities to construct the connection between students' own experience and reflection, which can effectively engage students in learning process. We hypothesized that leadership training experience would be positively related to students' service leadership behavior (Hypothesis 3).

Regarding the experience of being a leader, it is argued that students with relevant experience may have a deeper understanding of how to lead, motivate, unite people, and serve others [28]. Therefore, we hypothesized that the experience of being a leader would show positive correlation with service leadership behavior (Hypothesis 4).

OUR STUDY

The data were collected from an online questionnaire administered to undergraduate students from eight UGC-funded universities in Hong Kong in March 2016, which included The Hong Kong Polytechnic University (PolyU), The Chinese University of Hong Kong (CUHK), The Education University of Hong Kong (EdUHK), Hong Kong Baptist University (HKBU), City University of Hong Kong (CityU), Lingnan University (LU), The University of Hong Kong (HKU), and Hong Kong University of Science and Technology (HKUST). The research team in PolyU developed the questionnaire and set up the online survey. The local researchers in each university distributed the link to students. The participants were informed of the purpose of the study, and were assured that the data would be analyzed anonymously, and all information would be kept confidential. In addition, they were encouraged to response honestly based on their knowledge and impression about themselves. Each participant received a supermarket voucher of HK\$100 as a token of appreciation for completing the survey.

Data collection lasted for around four months from March till June 2017. A total of 4,555 participants completed the survey. Sixty-nine responses were excluded from the following analyses due to a denial of consent form, duplicated responses, and the responses completed by non-targeted group (e.g., graduates). After removing the invalid responses, the final sample consisted of 4,486 participants, including 2,969 females (66.2%) and 1,517 males (33.8%). The age of the participants ranged from 15 to 34 years old ($M = 20.47$, $SD = 1.67$). The demographic characteristics of the participants are showed in Table 1.

Table 1. Demographic characteristics of the participants

University	PolyU	CUHK	EdUHK	HKBU	CityU	LU	HKU	HKUST	Total
Participants (n/%)	1000/22.29	505/11.26	500/11.15	517/11.52	464/10.34	500/11.15	500/11.15	500/11.15	4486/100
Age range	18-27	17-29	17-34	15-28	18-34	18-29	17-28	16-28	15-34
Age (Mean/SD)	20.46/1.65	20.08/1.55	21.05/1.75	20.79/1.67	20.63/1.77	20.54/1.55	20.38/1.67	19.85/1.50	20.47/1.67
15-19 (n/%)	297/29.70	193/38.22	95/19.00	117/22.63	112/24.14	133/26.60	173/34.60	224/44.80	1,344/29.96

Measures

Based on the literature on the service leadership, the Service Leadership Behavior Scale was developed to measure the extent to which the participants demonstrate behaviors that are representative of a service leader. The SLB-SF-65 is measured on a 6-point Likert scale (1 = strongly disagree; 2 = disagree; 3 = slightly disagree; 4 = slightly agree; 5 = agree; 6 = strongly agree). Some sample items include: “I constantly seek to improve my personality,” “I strive to take care of other people regardless of their positions,” “when there is a problem, I can solve it quickly,” and “I am able to develop positive relationships with my friends.”

In the large-scale validation study, the SLB-SF-65 was refined based on exploratory factor analysis (EFA) and confirmatory factor analysis (CFA). Two subsets were randomly generated from the entire dataset (N subset A = 2,246; N subset B = 2,240). EFA was conducted on subset A to examine the factorial structure of the SLB-SF-65 by applying the principal component analysis. A trimmed scale (SLB-SF-48) containing 48 items was formed. Six factors were extracted, including self-improvement and self-reflection, people and principles orientation, resilience, social competence, problem-solving and mentorship. Details of the formation of SLB-SF-48 based on the EFA can be found in another article prepared by Shek and Ma in this book. CFA was performed on subset B using Maximum Likelihood estimation to evaluate the factorial structure. After removing ten items reflecting unsatisfactory factor loadings, and allowing the residual covariance for three pairs of parameters, we observed a significant improvement in goodness-of-fit. The resultant 38-item scale (SLB-SF-38) reflected a good fit (CFI = .92; NNFI = .91; RMSEA = .055), which met the benchmarks suggested by Hu and Bentler [34]. The SLB-SF-38 reflected the same factorial structure and labeling as the SLB-SF-48 did. In addition, the SLB-SF-38 showed good internal reliability (Cronbach Alpha = .96). The detailed information of CFA and indicators of the SLB-SF-38 are reported in another article submitted for the consideration of publication as well as in the User Manual. In the present study, the final data generated by CFA were used to develop norm tables and personal correlates.

Demographic Characteristics and Personal Correlates

Age and gender were two important demographic characteristics included in the present study. In addition, students' academic achievement, experiences of participating leadership training program, and being a leader were taken into account. Following previous research, we also used GPA to represent participants' academic achievement. The GPA systems in eight universities were adjusted and the GPA scores were standardized. Students were asked to report their recent GPA (ranging from 0-4), whether they have ever participated any leadership course or program (0 = No, 1 = Yes), and whether they have served in any leadership position in any organization (0 = No, 1 = Yes).

Data Analyses

We performed multiple regression analyses to examine the influence of gender and age on participants' behavior scores with SPSS version 23. If the behavior scores were

significantly predicted by gender, separate percentiles norms should be provided for female and male groups.

Normality tests were conducted for selecting the way to present norms. If the sample was normatively distributed, both the standardized scores and percentile norms would be presented. If the sample is non-normatively distributed, only the percentile norms would be provided.

When producing the norm data, we first presented the raw scores corresponding to the percentiles from 0 to 100. Second, the full tables presenting the percentiles for each raw score were provided. By doing so, the individual's score can be positioned precisely, which is useful for proper interpretation of the results. Crawford and colleagues [22] have suggested that though the behavior score is discrete, the underlying leadership ability is considered a continuous index. Thus, a given score x is actually a point estimate of the real valued behavior ability ranging from $x - 0.5$ (inclusive) to $x + 0.5$ (exclusive). In other words, given that the population distribution is unknown, the best estimation would be that the ability of half of the participants scoring x is actually below x and half above [22]. Thus, we followed Crawford et.al' suggestion on the definition of a percentile rank: the percentage of scores that fall below the score of interest and half of those obtaining the score of interest [22]. The calculation formula is showed as follows:

$$\text{Percentile rank} = \left(\frac{m + .5k}{N} \right) \times 100$$

In this formula, m refers to the number of participants scoring below a given raw score, k represents the number of participants that obtain a given raw score, and N means the entire normative sample size. The percentile ranks were calculated and rounded to integer.

For GPA, experience of leadership training and experience of being a leader, correlation analyses were applied to examine the potential relations between these factors and students' behavior scores with SPSS 23.

FINDINGS

The results of multiple regression analyses suggested that students' behavior scores were significantly predicted by gender, though the effect size was small ($\beta = .049$, $p < .001$; Cohen's $f^2 = .002$). In particular, female students obtained higher behavior scores ($Mean = 172.02$, $SD = 21.49$) than male students did ($Mean = 169.69$, $SD = 25.15$). Hypothesis 1 was supported. The influence of age on behavior scores was not statistically significant.

Tests for normality were conducted separately on female and male groups. The results of Shapiro-Wilk's test indicated that the distribution of behavior scores was non-normative for both female and male groups ($p < .001$) [35]. Field has suggested that the Shapiro-Wilk's test for large samples can be significant though the scores are only slightly different from a normal distribution [35]. Therefore, we also checked the histograms and the values of skew and kurtosis. The histograms showed a left-skewed and leptokurtic distribution for both

Table 2. Percentiles and corresponding raw scores of Service Leadership Behavior Scale (SLB-SF-38) by gender

Percentile (1-50)	Raw Score			Percentile (51-99)	Raw Score

female and male groups. In particular, the behavior scores yielded a skewness of -0.78 for male participants ($SE = .06$, $z\text{-value} = -12.37$, $p < .001$) and a skewness of -0.54 for female participants ($SE = .04$, $z\text{-value} = -11.99$, $p < .001$). In terms of kurtosis, the results showed a peaked distribution with positive kurtosis for both male (kurtosis = 2.23, $SE = .13$, $z\text{-value} = 17.79$, $p < .001$) and female groups (kurtosis = 1.76, $SE = .09$, $z\text{-value} = -19.61$, $p < .001$) [35]. According to the results of multiple regression and normality tests, we presented

Personal Correlates of Service Leadership Behavior Score

The results of correlation analysis suggested that the behavior scores were significantly correlated with GPA ($r = .10$, $p < .001$; $r^2 = .01$), experience of taking leadership course or training ($r = .13$, $p < .001$; $r^2 = .036$), and experience of being a leader ($r = .14$, $p < .001$; $r^2 = .028$). Students achieving higher GPA, having experience of taking leadership course or training, or having experience of being a leader were likely to have a better understanding of service leadership behavior. The results supported Hypotheses 2, 3 and 4, though the effect size of the correlates was low.

DISCUSSION

Using data collected through a survey carried out in eight UGC-funded universities in Hong Kong (*N* = 4,486), the present study examined percentile norms and important correlates of the service leadership behavior scores. This study responded the call for valid assessment tool evaluating university students' leadership behavior in a Chinese context.

Results showed that female students achieved higher behavior scores than male students did, which was in line with previous research [27, 29]. Though men are often perceived as having more leadership qualifications [36], females were found to perform better in building relationship with others, showing care and empathy, and leading in a transformational way. The development of service economy provides females more opportunities in professional development, which will improve gender equity in organizational leadership roles.

Our results also indicated that students who have attended leadership training course or have acted as a leader tended to perceive themselves having a higher level of leadership behavior. This implies the value of training programs in improving students' leadership, as the related training may enrich their knowledge and provide opportunities from them to reflect and practice leadership behavior. Similarly, acting as a leader directly provides specific task and contexts that students need to make decisions, coordinate, solve problems, and even handle conflicts, which will reinforce their leadership development. In addition, students' GPA was also positively correlated with their leadership behavior score. As GPA has been often used as an indicator of cognitive ability, students achieving high GPA may know how to choose learning strategies and possess the ability to work well with others in group projects, which will facilitate their learning process in relation to leadership development.

There are several theoretical, methodological, and practical implications. As stated earlier, numerous programs have been developed to respond the call for effective leaders in service economies. However, valid measurements are limited. This study tried to contribute to the literature by presenting the norms and correlates of service leadership scores. A main

methodological strength of this study is the development and validation of a measurement based on large sample size and confirmatory factor analyses. The findings also clarify the conceptual dimensions underlying the concept of service leadership behavior, which include self-improvement and self-reflection, people and principles orientation, resilience, social competence, problem-solving and mentorship dimensions revealed by the scale. This study also provides some practical implications for practitioners. The gender difference in service leadership behavior scores implies that more efforts should be made to improve male students' leadership performance.

Although we believe that our study has an addition to the Service Leadership Theory literature and leadership program evaluation, some limitations should be noted. More research variables can be included in the analysis to better understand the leadership behavior scores and variance. For example, students' Majors can have an influence on their service leadership behavior scores. It is possible that students majoring in helping professions, such as nursing, psychological counseling, education and social work, may possess a higher level of service leadership skills. As to the research sample, the present study was conducted solely in eight universities in Hong Kong, implying that some results may be difficult to be generalized to other contexts. For example, some idiosyncratic characteristics of Hong Kong, such as its long-standing service economy, can have an influence on the norm data. In addition, as one of our research aims was to evaluate leadership programs in higher education, only university students were involved in our study. Special attention should be paid to this issue when using the Service Leadership Behavior Scale in other populations. Despite these limitations, the present study contributes to the current literature by providing norm data of Service Leadership Behavior Scale to evaluate individual's leadership behavior and monitor their improvements.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University. This chapter is an updated version of a publication in the special issue "Development and validation of assessment tools on service leadership knowledge, attitude and behavior" edited by Daniel TL Shek, Xiaoqin Zhu and Joav Merrick published in the *International Journal of Child and Adolescent Health*, 2018;11(4).

ABSTRACT

With a strong evidence base linking leadership knowledge to leadership practices, the Service Leadership Knowledge Scale was developed as an objective assessment tool to assess an individual's knowledge pertaining to Service Leadership based on the Service Leadership Theory. With an initial item pool of 200 items, the final Service Leadership Knowledge Scale consists of 40 items which demonstrated robust psychometric properties. In this chapter, a brief introduction of the development of the Service Leadership Knowledge Scale as well as its conceptual framework is attempted. The validation process, norm statistics, administration notes, and guidelines for scale score interpretation are also discussed.

INTRODUCTION

Owing to the transformation in economic composition amongst capitalist societies across the globe, Hong Kong, as a cosmopolitan Asian financial hub, has transitioned from the once manufacturing-dominant economy to a service-driven economy [1-3]. According to the Information Services Department [4], nearly 90% of jobs in Hong Kong are currently service-oriented. This shift in the economic structure has huge implications on what constitutes good leadership practices in this age [2, 5]. Po Chung, the co-founder of DHL International and the incumbent chairperson of the Hong Kong Institute of Service Leadership and Management Limited (HKI-SLAM), asserted that a corresponding evolution to a service mentality, which stresses nurturance of human assets, autonomy, and innovation [2], is the key to leadership success in this Service era [6].

Obviously, such an evolution cannot be taken for granted. As stated by Shek et al. [3], there is still a noticeable incompatibility between what is valued amongst the potential employers vis-à-vis the graduates or the employees in certain service sectors. Such a discrepancy does not only engender mismatch in recruitment and under-utilization of talents [8] but also deterioration in employees’ job satisfaction as well as mental and physical well-being [9]. In view of such a backdrop, the Service Leadership and Management (SLAM) framework was put forth by HKI-SLAM, with the vision to educate a new generation of service leaders who can thrive in the contemporary service economy by possessing task-specific competences, a caring disposition, and capability to make morally correct decisions [3, 10].

According to the SLAM framework, effective leadership is conceptualized as a “service aimed at ethically satisfying the needs of self, others, groups, communities, systems, and environments” [11, p. 233]. To put this in the context of leadership education, Chung and Bell [12] proposed 25 defining principles of effective Service Leadership which are subsumed under seven Core Beliefs (see Table 1).

Table 1. The seven core beliefs of the SLAM framework (HKI-SLAM, n.d.)

Core Beliefs (CB)
CB1: Leadership is a service aimed at ethically satisfying the needs of self, others, groups, communities, systems, and environments.
CB2: Everyday, every human occupies a position of leadership and possesses the potential to improve his or her leadership quality and effectiveness.
CB3: Leadership effectiveness and service satisfaction are dependent on a leader or service provider possessing relevant situational task <i>competences</i> plus being judged by superiors, peers, and subordinates as possessing <i>character</i> and exhibiting <i>care</i> .
CB4: Service includes self-development efforts aimed at ethically improving one’s competences, abilities, and willingness to help satisfy the needs of others.
CB5: Service Leadership is about creating appropriate personal service prepositions in real time and constantly striving to provide the highest quality service one afford to everyone one comes into contact with and whose lives are affected by one's actions or leadership.
CB6: Service Leadership is the world’s oldest, most competitive, and longest surviving business model.
CB7: Now and in the future, high-paying, high-status positions and management promotions will go to people who have domain-specific knowledge and skills plus Service Leadership competences, appropriate character strengths and a caring social disposition.

Note. Adapted from Shek and Lin (2015).

Furthermore, Chung and Elfassy [6] highlighted 12 areas of personal qualities instrumental to Service Leadership. These include Expertise, Character, Compassion, Relationship, Daily Management, Happiness, Intellectual, Inspirational, Health, Security, Follower, and Maturation dimensions. As Chung and colleagues [12, 13] astutely pointed out, these 12 dimensions boil down to three core features of an effective Service Leader, which are Competence (i.e., “doing things right”), Character (i.e., “doing the right things”), and Caring (i.e., “serving with an unselfish intent”). In a nutshell, both the seven core beliefs and the 3-Cs of Service Leadership outline the theoretical foundation of the model of Service Leadership education [i.e., 14, 15].

With the objective of nurturing and developing future leader with service mindset and key Service Leadership qualities the Victor and William Fung Foundation financed the “Fung Service Leadership Initiative” (FSI) in eight government-funded Hong Kong universities from 2012 to 2015. To assess one’s attitude, knowledge, and behavior in an objective manner, three assessment tools were developed and subsequently validated [3].

This manual outlines the development and validation of the Service Leadership Knowledge Scale (SLK-SF-40), including its conceptual framework, item development, psychometric properties, and potential use. Validity and reliability of the finalized scale are provided to corroborate its effectiveness on measuring knowledge of Service Leadership. Administration guidelines and interpretation on raw scores are also included for scale users to have a better understanding when using the scale.

CONCEPTUAL FRAMEWORK

On the basis of the SLAM framework [10], 25 Principles of Service Leadership [12], the 12 Dimensions of a Service Leader [6], and related literature [e.g., 16, 17], the initial item pool containing a total of 200 multiple-choice items was developed covering seven crucial domains of knowledge points pertaining to the Service Leadership paradigm. These included a) General description of Service Leadership, b) Three realms of Service Leadership, c) Principle “E (Effective Leadership) = 3Cs (i.e., Competence, Caring Disposition, and Moral Character)”, d) Manufacturing vs. service economies and current societal status, e) Distinction of Service Leadership and other leadership theories, and f) other knowledge points in SLAM framework. Table 1 provides an overview of all the above-mentioned domains and the coverage for each of them. Detailed description regarding each domain are documented in the previously published work [e.g., 3, 7].

DIFFERENT STAGES OF THE VALIDATION PROCESS

The Long-Form Service Leadership Knowledge Scale (i.e., SLK-LF-200) including 200 English items was developed by Shek et al. [3] with the primary purpose of examining the “essential knowledge points of Service Leadership in the format of multiple-choice questions” [3, p.164].

Following the initial development of the item pool, the knowledge scale was subjected to multiple stages of the validation process. The following steps below summarizes the three validation studies which ultimately led to the trimming of the initial 200-item knowledge scale to the final version that contained roughly one-fifth of the items in the initial item pool:

Stage 1: A content validation study was conducted to exam the 200-item SLK-LF-200. A group of experts who were previously involved in the development of the SLAM curriculum evaluated the 200 items based on three criteria, including relevance, clarity, and representativeness. The analyses revealed that the SLK-LF-200 demonstrated meritorious content validity on both the individual item and the scale levels [3, 7].

Stage 2: The SLK-LF-200 was administered to 160 PolyU students in a criterion-related validation study. Amongst them, 67 took a three-credit course “Service Leadership” before served as the experimental group, while the remaining 93 students who had not taken the course served as the control group. Analyses revealed that the experimental group performed significantly better in all component scores as well as the composite score for the SLK-LF-200, indicating good criterion validity of the scale. Additionally, analyses on the individual item revealed that the experimental group outperformed the control group on 63 items. These 63 items were subjected to further screening, resulting in the removal of 13 items based on item duplication and face validity concern [18]. Eventually, these 50 items constituted the Short-Form Service Leadership Knowledge Scale (i.e., SLK-SF-50) which were utilized in a large-scale validation study involving 4,486 university students [18, 19].

Stage 3: The SLK-SF-50 was administered to 4,486 undergraduates from eight government-funded universities in Hong Kong. Initial inspection of reliability informed the deletion of ten items due to low item-total correlations (i.e., < 0.30). Consequently, a single-factor, 40-item factorial solution (i.e., SLK-SF-40) was subjected to confirmatory factor analysis (CFA) using the robust weighted least squares (WLSMV) estimation [18].

Overall, the goodness-of-fit statistics, which were detailed in Section 5 of the present manual, underscored the factorial validity of the proposed SLK-SF-40. Aside from recording good internal consistency, the SLK-SF-40 also exhibited robust convergent validity as evidenced by its significant correlations with different constructs theorized to be relevant to the SLAM curriculum.

DESIGN AND USE OF THE SCALE

As above mentioned, the original item pool of the SLK-LF-200 was developed based on the SLAM framework and other related publications from the Service Leadership literature. These items, written in English and taking the form of multiple-choice questions, were created with the objective to measure respondents’ “understanding of the fundamental knowledge points that a Service Leader is expected to obtain” [3, p. 166]. The final version of the scale (i.e., SLK-SF-40) is comprised of 40 items (see Table 2 for three sample items)

assessing mastery of key knowledge points in Service Leadership as a unidimensional construct [see 18]. For each item, there is a correct answer, where “1” (“0”) point is scored for each correct (incorrect) answer. A higher total score (out of 40) is indicative of the acquisition of more key knowledge points of Service Leadership [3, 18]. The final 40-item version of the Service Leadership Knowledge Scale (SLK-SF-40) was revised based on findings from the psychometric analyses.

Table 2. Three sample items of the SLK-SF-40

Items	Options	Model Answers
6. A manager under the service economy plans to hire someone. Based on the Service Leadership model, which of the following advice would you give him/her?	A. Hire for qualifications, train for character B. Hire for character, train for skills C. Hire for attitude, train for character D. Hire for efficiency, train for mindset	B
28. Which of the below attributes constitutes one of the three key components of Caring Disposition according to the Service Leadership and Management (SLAM) model?	A. Responsibility B. Conscientiousness C. Empathy D. Warmth	C
39. According to the 25 Principles of Service Leadership, which of the below statements is most appropriate?	A. It is not the Service Leaders' responsibility to predict and avoid errors that are costly to one's service reputation. B. Service Leaders should hide the errors that are costly to one's service reputation. C. Service Leaders can easily make amends for errors detrimental to one's service reputation. D. Service Leaders have to try to predict and avoid errors that are costly to one's service reputation.	D

Note. These sample items were slightly re-worded to minimize familiarity effect.

Target Respondents

The SLK-SF-40 was targeted at the undergraduate and adult population in Hong Kong and other Chinese communities (i.e., Taiwan and mainland China). Norms based on other populations may be needed when the scale is used elsewhere because the normative data reported in this manual were based on university students in Hong Kong.

Instructions

The SLK-SF-40 is administered in a self-report manner in English. A standardized set of instructions is provided as illustrated in Figure 1, while slight modifications in wordings may be acceptable. A cover page including a) the objective of the survey, b) the emphasis on

voluntary participation and data confidentiality, c) compensation (in terms of credit or pecuniary interest if applicable), d) contact details of the administrators or the researchers, and e) options for potential respondents to agree or refuse to join the study should be included. While no time limit is explicitly specified, the normal completion time for SLK-SF-40 is around 30 minutes.

Information on the personal particulars of respondents may be sought (see Figure 2). Additional items may be included depending on the test administrators’ needs (e.g., whether a repeated/pretest/posttest design is utilized) as well as the characteristics of the target sample (e.g., an undergraduate sample or a group of adult trainees signed up to certain training course in Service Leadership).

Please read each question carefully and select the best option to your understanding about leadership. The following questions are about Service Leadership and Management (SLAM) Model. No matter whether or not you have learned anything about this model, please respond to the questions based on what you know as of this moment.

Figure 1. A sample introductory note.

The below contains questions on personal particulars of yours. Please select or write down your answers in the space provided.

*Please delete as appropriate

1. Your 8-digit student ID:
2. Your Gender: *Male/Female
3. Age:
4. Have you taken any of the following credit-bearing Service Leadership courses (You may select multiple answers)?
5. Have you ever participated in any of the below non-credit bearing Service Leadership programs organized by your university (You may select multiple answers)?
6. Have you ever taken any other leadership training (e.g., any extra-curricular activities that warrant applications of your leadership competence)? *Yes/No
7. How much do you think you know about “Service Leadership”? *No Knowledge/Little Knowledge/Some Knowledge/A Lot of Knowledge/All the Knowledge
8. Have you worked before (You may select multiple answers)? *No Work Experience (single choice only)/Full-Time Work/Part-Time Work/Internship

Figure 2. Sample questions on respondents’ personal information.

Administration Guidelines

While users are at liberty to customize the cover page, introductory notes, the personal information sheet as well as the mode of administration (i.e., electronic or paper-based) according to their needs, the following points should be strictly observed:

1. The full title of the test “Service Leadership Knowledge Scale” should not appear or be explicitly announced anywhere in the introductory note.
2. Even though the SLK-SF-40 was constructed as a knowledge test pertaining to the SLAM curriculum, it can still be utilized to gauge the individual’s “baseline”

knowledge concerning Service Leadership before the start of any training programs or workshops. Specifically, upon administration to respondents who are untrained in Service Leadership, the users may remind the respondents to just respond to the items based on their current knowledge.

3. The scale must be completed by the participant on his/her own. No discussion or collaboration with fellow participants should be permitted. Furthermore, the scale must be administered in a closed-book fashion, meaning that participants are not allowed to search for answers from the Internet, lecture notes and/or other relevant materials (e.g., books or journal articles) throughout the test. The test administrator, however, may offer explanations for certain specific terms (e.g., decentralized, formalized, etc.) when participants express difficulties in comprehending those terminologies. While no specific time limit is stipulated, the normal time of completion of the SLK-SF-40 is approximately 30 minutes.
4. It is advisable that the SLK-SF-40 be administered by trained personnel including, but not limited to teachers, psychologists or social workers, or self-administered in the presence of such qualified users on an individual or a group basis. Under normal circumstances, the scale should be completed in ONE setting. Should the paper-based version be utilized, the questionnaire ought to be collected by the test administrators immediately upon completion.

RELIABILITY AND VALIDITY

Normative sample in this manual was derived through a large-scale validation study involving 4,486 university students in Hong Kong. All analyses presented in this chapter are based on the normative sample data.

Internal Consistency

Analyses revealed that the SLK-SF-40 possesses excellent internal consistency, with the Kuder-Richardson 20 (KR-20) coefficient = 0.94. To inspect the internal consistency of the SLK-SF-40 across gender and various age groups, KR-20 coefficients and mean inter-item correlations were also computed for each gender and age group (see Tables 3 and 4, respectively). The KR-20 coefficients, as shown in tables 3 and 4, were over 0.90 across gender and different age groups. Additionally, the mean inter-item correlations for all four sub-groups were within the optimal range (i.e., 0.20 to 0.40) defined by Briggs and Cheek [20]. Taken together, the SLK-SF-40 demonstrates excellent internal consistency in the present sample.

Table 3. Reliability indices by gender

Reliability indices	Male (N = 1,517)	Female (N = 2,969)	Total (N = 4,486)
Kuder-Richardson 20	0.94	0.94	0.94
Mean inter-item correlations	0.28	0.27	0.28

Table 4. Internal consistency Kuder-Richardson 20 coefficients by age groups

Reliability indices	15-19 (N = 1,344)	≥ 20 (N = 3,142)	Total (N = 4,486)
Kuder-Richardson 20	0.94	0.94	0.94
Mean inter-item correlations	0.28	0.28	0.28

Table 5. Correlations between SLK-SF-40 and the adopted external criterion scales

Correlations with the external criterion scales (and subscales)	Z-scores of difference between <i>rs</i> with SLK-SF-40:						
	α (MITC)	<i>r</i>	MSC	LEF	IRI	IRI-EC	IRI-PT
1. RSLP	0.94 (0.46)	0.200***	-16.17***	4.83***	-16.92***	-14.15***	-10.09***
2. MSC	0.83 (0.44)	0.361***	—	15.11***	-6.25***	-4.31***	1.12

4. IRI	0.74 (0.17)	0.438***	—	—	—	2.97**	12.91***
4a. IRI- EC	0.62 (0.19)	0.419***	—	—	—	—	5.64***
4b. IRI- PT	0.58 (0.19)	0.346***	—	—	—	—	—

Note. ** $p < .01$ (two-tailed). *** $p < .001$ (two-tailed). MITC: Mean inter-item correlations. RSLP: Revised Servant Leadership Profile; MSC: Moral Self-Concept; LEF: Leadership Efficacy; IRI: Interpersonal Reactivity Index; IRI-EC: Subscale “Empathic Concern”; IRI: PT: Subscale “Perspective Taking”.

Concurrent Validity

Aside from the strong internal consistency, the SLK-SF-40 was demonstrated to be valid as it was associated with various measures of theoretically-relevant constructs, including empathy and servant leadership. As detailed in Table 5, the composite score of SLK-SF-40, which was calculated via summing each participant’s correct response to every item, was positively and significantly (all $ps < .001$, two-tailed) correlated to well-established external measures of Servant Leadership ($r = 0.20$), Moral Self-Concept ($r = 0.36$), Leadership Efficacy ($r = 0.13$), and Empathy (i.e., Interpersonal Reactivity Index, $r_{\text{composite}} = 0.44$, $r_{\text{empathic concern}} = 0.42$, and $r_{\text{perspective taking}} = 0.35$). Notably, comparisons [21, 22] revealed that the SLK-SF-40 was correlated most strongly with the empathy measure while least correlated with the leadership efficacy measure (see Table 6).

The concurrent validity of the SLK-SF-40 was further supported by its correlations with the final versions of the two other measures of Service Leadership. As demonstrated in Table 6, the SLK-SF-40 was positively and significantly correlated with both the 38-item Service Leadership Behavior Scale (SLB-SF-38, $r = 0.18$) as well as the 46-item Service Leadership Attitude Scale (SLA-SF-46, $r = 0.38$). The SLK-SF-40 was also positively and significantly correlated with most of the subscales of the SLB-SF-38 and SLA-SF-46 (see Table 6). Additionally, comparison of the strengths of correlation [21, 22] revealed that the SLK-SF-40 was significantly more strongly linked to the SLA-SF-46 than to the SLB-SF-38 (see Table 6).

Table 6. Correlations between SLK-SF-40 and other Service Leadership scales (and subscales) under validation

Total																	

Note. ^aUnless otherwise specified by the superscript “n.s.” which denotes statistical non-significance, all other Z-scores of difference were significant at $p < .05$ (two-tailed) (i.e., $|Z\text{-score}| > 1.96$). ** $p < .01$ (two-tailed). *** $p < .001$ (two-tailed). MITC: Mean inter-item correlations. SLB-SF-38-Total: Scale score of the six-factor, 38-item Service Leadership Behavior (SLB) Scale; SLA-SF-46-Total: Scale score of the eight-factor, 46-item Service Leadership Attitude (SLA) Scale; SLB-SF-38-F1: SLB Factor 1 “Self-improvement and self-reflection”; SLB-SF-38-F2: SLB Factor 2 “People and principles orientation”; SLB-SF-38-F3: SLB Factor 3 “Resilience”; SLB-SF-38-F4: SLB Factor 4 “Social competence”; SLB-SF-38-F5: SLB Factor 5 “Problem-solving”; SLB-SF-38-F6: SLB Factor 6 “Mentorship”; SLA-SF-46-F1: SLA Factor 1 “Vision and competence”; SLA-SF-46-F2: SLA Factor 2 “People orientation”; SLA-SF-46-F3: SLA Factor 3 “Caring disposition”; SLA-SF-46-F4: SLA Factor 4 “Ethical role model”; SLA-SF-46-F5: SLA Factor 5 “Social competence”; SLA-SF-46-F6: SLA Factor 6 “Self-understanding and reflection”; SLA-SF-46-F7: SLA Factor 7 “Positive view about human beings”; SLA-SF-46-F8: SLA Factor 8 “Unchangeable and dark human nature”.

In short, findings from the correlational analyses provided a solid convergent evidence base for the construct validity of SLK-SF-38. Besides recording significant and positive correlations with constructs theorized to underpin the SLAM curriculum [10], the SLK-SF-40 also demonstrated significant correlation with the two separate objective assessment tools of Service Leadership.

Factorial Validity

We subjected the proposed one-factor structure of the SLK-SF-40 to a Confirmatory Factor Analysis (CFA) using Mplus version 6.12 [23]. Overall, the goodness-of-fit statistics (e.g., CFI, NNFI, and RMSEA) strongly supported the unidimensional structure of the SLK-SF-40 (see Table 7). Almost all indices, with the exception of WRMR, met the well-established criteria of adequate fit according to the literature [24]. Besides, as indicated in Table 8, the standardized factor loadings of all 40 items ranged from moderate to strong (i.e., 0.32 to 0.90) and were statistically significant ($p < .001$, two-tailed). In short, the present study supports the unidimensionality of the SLK-SF-40 [18].

Table 7. Model fit indices of the one-factor SLK-SF-40

Model Tested	χ^2	df	WRMR	NNFI	CFI	RMSEA (pclose)	RMSEA (90% CI)
One-factor	3,492.44	740	1.725	0.985	0.984	0.029 (1.00)	0.028/0.030
Criterion for goodness-of-fit	-	-	≤ 0.90	≥ 0.95	≥ 0.95	≤ 0.05	≤ 0.08

Note. WRMR = weighted root-mean-square residual; NNFI = Bentler-Bonett Nonnormed Fit Index; CFI = comparative fit index; RMSEA = root mean square error of approximation; pclose = probability of RMSEA ≤ 0.05 ; 90% CI = 90% Confidence Intervals (lower value/upper value).

NORMS

Student participants in this normative sample were recruited from the undergraduate programs of eight government-funded universities in Hong Kong. As the lead institution, the research team at the Hong Kong Polytechnic University utilized the “mySurvey@PolyU” electronic survey system to prepare the online survey and shared the link to the coordinators of all other participating institutions. The coordinators then sent the prepared online survey link to students who were interested in taking part. All prospective respondents were well informed about the principles of voluntary participation, anonymity, and rights to withdraw from the study at any time prior to the start. As a token of appreciation, each respondent was entitled to a local supermarket voucher valued at HK\$100 upon completion.

The data collection lasted from late March to early June in 2017. After excluding invalid cases such as repeated participation and participant ineligibility, a total of 4,486 sets of responses were included in the final sample for normative analysis. The participants were aged between 15 and 34 years ($M = 20.47$, $SD = 1.67$), comprised of 2,969 (66.18%) female students and 1,517 (33.82%) male students.

Table 8. Confirmatory Factor Analysis Loadings

Items	Mean ^a (Standard Deviation)	Accuracy Rate ^b	Standardized factor loadings	R- squared	Residual variance	Corrected Item-total Correlations

Normative Statistics

As the raw scores in the full normative sample and sub-groups (i.e., male and female groups) did not follow a normal distribution, instead of using z scores, percentile ranks were

calculated. Norms of the total score of the full normative sample and sub-groups are presented in Table 9 (percentile ranks and corresponding raw scores) and Table 10 (raw scores and equivalent percentile ranks).

Table 10. Raw scores and related percentiles for Service Leadership Knowledge Scale (SLK-SF-40)

40	100.0	100.0	100.0

SCORING AND INTERPRETATION

The SLK-SF-40 is consisted of 40 items, and each has a correct answer. Each participant's answer on each item was coded as "1" or "0" to indicate a correct or incorrect answer, respectively. A total score across the 40 items is computed as the Service Leadership knowledge score, with a maximum score of 40.

Handling Missing Items

Completion of all items in the present scale is important to ensure satisfactory reliability of the scale. Results have to be interpreted cautiously in the event of missing responses. The responses with missing value(s) should be excluded from data analysis or be imputed with appropriate method prior to further analysis.

Interpretation of Test Scores

The objective of SLK-SF-40 is to measure participants' mastery of key knowledge points in Service Leadership. Interpretation of SLK-SF-40 test score is based on the full scale. A higher total score (out of 40) is indicative of the acquisition of more key knowledge points a Service Leader is expected to have.

Table 9 shows percentile norms for the scores of SLK-SF-40. Percentile rank of a specific raw score represents the percentage of people in the normative sample whose score is the same or lower than the specific raw score for a particular measure. In other words, the percentile rank of an individual shows his/her standing in the relevant group. Taking a female student who gets score of 30 as an example, her received score has made her surpassed more than half (60%) of all female students.

As mentioned in earlier section, a higher total score indicates one has more understanding of key knowledge points on Service Leadership. There is no specific cut-off value to segregate "rich" from "inadequate" knowledge on Service Leadership. When interpreting test scores, scale users (i.e., researchers or program evaluators) are recommended to locate the score of the participant from the norm tables to gauge his/her relative position regarding Service Leadership knowledge. Scale users may utilize expressions such as "less as compared to the normative sample", "similar to the normative sample", or "more as compared to the normative sample" to describe participants' different levels on Service Leadership knowledge.

To evaluate the effectiveness of Service Leadership training program, it is recommended that the scale be administered by the program evaluators prior to and after completion of the program. Evaluators can compare participants' received score in pre and post-test, which means scores can be used without referring to the norm table.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this paper is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University.

ABSTRACT

As there are few objective measures of attitudes to leadership in the service economies, The Service Leadership Attitude Scale was developed to assess an individual's attitudes towards leadership and effective leadership in the service economies. The scale was based on the Service Leadership Theory proposed by Po Chung. With an initial item pool of 132 items, the final scale comprises 46 items which showed very good psychometric properties. In this chapter, the background of the development of this scale, validation process and the psychometric properties of the scale are presented. Reminders for administration of the scale and guides for interpretation of the scales are also outlined.

INTRODUCTION

Hong Kong has an economy heavily depending on traditional and creative service industries which contribute 92.2% to the total Gross Domestic Product (GDP) and 92.7% to the employment [1]. To sustain the competitive advantage of Hong Kong's service industries in the Asian Pacific region and even in the whole world market, service leaders are expected to be people-oriented and care about individual human needs including not only one's own but also others' needs as well as wellness of group, environment and the society. To this end, Po Chung proposed a new concept of Service Leadership Theory, which regards leadership as "a service aims at ethically satisfying the needs of self, others, groups, communities, systems, and environments" and stresses on humanistic values, moral ethics, and care of a service leader [2].

Guided by the Service Leadership Theory, and financially supported by the Victor and William Fung Foundation, the "Fung Service Leadership Initiative" (FSI) was implemented in the eight government-funded universities in Hong Kong from 2012 to 2015, with an aim of spotting and nurturing future leaders with service mindset and key service leadership qualities. To evaluate service leadership attributes and the effectiveness of service leadership education, it is imperative to have validated assessment tools specifically designed based on Service Leadership Theory. Thus, three assessment tools including knowledge, attitude, and behavior scales were developed and validated. While this manual focuses on the attitude scale and its finalized 46-item version (i.e., SLA-SF-46), the other two scales are introduced in respective user manuals.

This manual was written for potential users of the SLA-SF-46, including university teachers, program evaluators, human resources trainers, and employers. There are five purposes of this manual. First, it provides the scale users a brief description of the conceptual framework of Service Leadership Attitude Scale. Second, it introduces how the different versions of the scale were developed. Third, it presents statistical evidence documenting the reliability and validity of the finalized scale as an effective measure of service leadership attitude. Fourth, the manual presents normative statistics for interpretation of raw scores. Finally, the manual provides users with other information they need to administer the test and interpret the results.

CONCEPTUAL FRAMEWORK

Service Leadership Theory is characterized by several unique features, such as the seven core beliefs (e.g., everyone can be a leader and three realms of leadership) [3] and the strong emphasis on service orientation and self-leadership [4, 5]. Based on these propositions, attitude toward service leadership was conceptualized as one's beliefs and perceptions about the nature of leadership process and role of a leader with reference to the eight domains. These domains are briefly outlined below, and detailed elaborations can be found elsewhere [6].

The first domain pertains to service orientation. Service leaders should see leadership as a service rather than a tool merely for generating profits. Modern service leaders are expected to believe in the importance of contributing to improving service ecology without instant

economic returns, which enhances wellbeing at the societal level and benefits all market participants in the long run.

The second domain is pertinent to the belief that “everyone can be (and is) a leader.” It has been shown that leadership in the service sectors is a learned behavior rather than a natural gift [7, 8]. When leaders establish the sense that leadership qualities are not innate but learned, they can better recognize and nurture followers’ potential and maximize followers’ personal contribution.

The third domain is seeing distributed leadership as a desirable leadership practice. Distributed leadership allows employees to extend their roles in implementing service improvement by initiating changes from the bottom [9]. This process of shared decision making and empowerment entails employees to see themselves as part of the organization which increase job performance and commitment.

Fourth, service leaders believe that service leadership increases employability. Service leadership is built upon professional competence, moral character and caring disposition, which are fundamental leadership qualities demanded in modern service industries. Thus, belief is expected to be established among service leaders that service leadership increases the likelihood of being employed and being a service leader will enjoy monetary and spiritual benefits [3].

The fifth domain has to do with the belief of providing personalized service and being sensitive to people’s diversified needs. With the rapid development of technologies, traditional notion of delivering “one-size-fits-all” service to customers is no longer an optimal choice in the modern service era [3]. Instead, how to provide customized service that fits each individual’s needs has become the key area of competition [11].

Sixth, service leaders believe that providing service is intrinsically enjoyable to the service providers. High-quality service provision is more likely to be invigorated in the organizations with enjoyable atmosphere, where leaders and followers are not motivated only by external rewards such as economic returns. Service leaders believe in the importance of service passion and cultivate service enthusiasm among subordinates.

Seventh, service leaders believe that good leaders should demonstrate competence, character, and care (3Cs). For competence, it is important to possess multiple intrapersonal and interpersonal skills, so as to fulfill one’s duties. For character, service leaders must be aware of the importance of “doing the right thing” in right ways. Regarding the importance of care, it is well known that caring behaviors of a leader as a service-provider will breed trust, loyalty and commitment in the followers and service recipients [3].

The eighth domain is about commitment to continuous improvement. In addition to serving others, service leaders are also expected to realize the need of serving oneself by continuously improving oneself, in order to accumulate resources and capacities to serve and lead others more effectively.

DIFFERENT STAGES OF THE VALIDATION STUDY

To further support the development of service leadership education in Hong Kong, the Victor and William Fung Foundation provided additional funding for the eight universities which collaborated in developing and validating scales on the service leadership knowledge,

attitude and behavior in 2015. As far as the development of the attitude scale is concerned, several stages were involved as follows:

Stage 1: With reference to the conceptual framework mentioned before, the original long-form Service Leadership Attitude Scale including 132 items (i.e., SLA-LF-132) was developed.

Stage 2: The SLA-LF-132 was initially validated through a content validation study involving three experts [6] and a quasi-experimental study. Based on the results of an exploratory factor analysis (EFA) which utilized the pre-test data collected in the quasi-experimental study, 73 items with a 5-factor structure were retained to form a short-form attitude scale (SLA-SF-73). The SLA-SF-73 demonstrated good reliability.

Stage 3: The SLA-SF-73 was subject to a large-scale validation study involving 4,468 undergraduates recruited from the eight public universities in Hong Kong. Based on EFA using a sub-sample ($N = 2,246$), 46 items with a 7-factor structure were retained to form a new short-form scale (i.e., SLA-SF-46E). The SLA-SF-46E showed excellent internal consistency and strong convergent validity [11].

Stage 4: The SLA-SF-46E was subject to confirmatory factor analysis (CFA) based on another sub-sample ($N = 2,240$), which informed a finalized 46-item scale with an 8-factor structure (i.e., SLA-SF-46). The finalized scale and its eight subscales showed good reliability and convergent validity, which will be reported in Section 5 of this manual.

DESIGN AND USE OF THE SCALE

The item contents of the attitude scale were derived from two sources. First, some items were modified from existing measures on attitude [12-14]. Second, some items were specifically constructed with reference to the conceptual framework and related service leadership curriculum. In the finalized scale (i.e., SLA-SF-46), 46 items were structured into 8 factors. The names and sample items of these factors are listed below:

- Factor 1: Vision and competence (10 items). A hypothetical sample item is “good leaders do not give in easily when facing challenges.”
- Factor 2: People orientation (8 items). A hypothetical sample item is “good leaders encourage subordinates to contribute their ideas.”
- Factor 3: Caring disposition (7 items). A hypothetical sample item is “good leaders help followers develop their talents.”
- Factor 4: Ethical role model (5 items). A hypothetical sample item is “leadership effectiveness is largely dependent on ethical beliefs of the leader.”
- Factor 5: Social competence (4 items). A hypothetical sample item is “good leaders have good interpersonal skills.”
- Factor 6: Self-understanding and self-reflection (5 items). A hypothetical sample item is “good leaders have much self-reflection.”

- Factor 7: Positive views about human beings (2 items). A hypothetical sample item is “everyone has what it takes to be a leader.”
- Factor 8: Unchangeable and dark human nature (5 items, reversed). A hypothetical sample item is “We have to closely monitor subordinates’ work to make sure that they are not lazy” (reverse-item).

Target Respondents

The SLA-SF-46 was designed for university students and employees who may receive training on service leadership. In principle, its target population is Chinese people who are or will be taking a leading role in service sectors in Hong Kong and other Chinese communities such as mainland China and Taiwan. When using the scale outside Hong Kong, it is necessary to construct local norms as the normative sample included in this manual was based on university students in Hong Kong.

Instructions

The SLA-SF-46 is administered in English. The questionnaire is normally completed in the self-administered manner. The scale should not be issued to respondents before they give formal consent to complete the scale. Before responding to scale items, participants should read through the instructions presented at the beginning of the questionnaire.

There is no specific time limit for respondents to complete the whole questionnaire. Generally speaking, the scale can be completed within 20-30 minutes. In principle, the questionnaire should be completed and collected in the administration venue and must not be taken away by the respondents.

Administration Notes

Different users may adapt the instructions and response format by complying with the following principles:

- 1) The questionnaire should be completed by respondents alone. Participants are not allowed to discuss with each other about the items.
- 2) Field administrators may explain grammatical and expression issues raised by respondents who have difficulties in understanding the meaning of any specific words or phrases. However, respondents should respond to the items according to their own interpretations.
- 3) The scale can be adopted in terms of full scale or individual subscales. However, the items included in a specific subscale should be fully utilized without any deletion.
- 4) SLA-SF-46 uses a 6-point Likert scale ranging from 1 (Strongly disagree) to 6 (Strongly agree). Testers should use the same rating scale.

- 5) SLA-SF-46 can be administered in paper-and-pencil or computerized formats. If the questionnaire is completed in the paper-and-pencil form, the completed questionnaires must be submitted to field administrators immediately. The questionnaires are not allowed to be retained or taken away by participants.

RELIABILITY AND VALIDITY

The normative sample was obtained in the large-scale validation study mentioned above. The psychometric properties of SLA-SF-46 were examined based on the normative sample and following sections briefly describe related findings.

Internal Consistency/Reliability

Results showed that SLA-SF-46 and its eight factors demonstrated good internal consistency, as reflected by Cronbach’s alphas ranging from .70 to .93 and mean inter-item correlations ranging between .28 and .56 (see Table 1).

Table 1. Internal consistency of SLA-SF-46 and its subscales

Scale/subscale	No. of items	Cronbach’s alpha	Mean Inter-Item Correlations
Vision and competence	10	.90	.46
People orientation	8	.87	.47
Caring disposition	7	.86	.47
Ethical role model	5	.85	.53
Social competence	4	.83	.56
Self-understanding and self-reflection	5	.82	.49
Positive view about human beings	2	.70	.54
Unchangeable and dark human nature	5	.79	.42
Full scale	46	.93	.28

Convergent Validity

The convergent validity of SLA-SF-46 was supported by the correlations among its subscales (see Table 2) and their correlations with external criterion constructs (see Table 3), including service leadership knowledge, service leadership behavior, servant leadership, moral self-concept, leadership efficacy, interpersonal reactivity index, empathic concern, and perspective thinking.

Factorial Validity

The 8-factor structure was shown to be the best solution fitting for the finalized 46-item attitude scale (i.e., SLA-SF-46). CFA based on the full normative sample (*N* = 4,486) yielded

good fit indices of the 8-factor structure, with CFI = .92, TLI = .91, RMSEA = .044 (90% CI = [.043, .045]). As shown in Table 4, majority of factor loadings were above .60.

Table 2. Inter-factor correlations of finalized attitude scale/subscales

The related findings for the different validation studies can be seen in publications about background and development of the scale [15], content validation study [6], psychometric properties of the SLA-SF-46E obtained based on EFA [11], and a manuscript under preparation which aims to present findings of CFA using the normative sample and psychometric properties of the SLA-SF-46. In addition, norms and personal correlates of attitude to service leadership with reference to the full scale of SLA-SF-46 have also been reported by Shek and colleagues [16]. Section below will further present norms of SLA-SF-46 based on its full scale and subscales as well.

NORMS

The snowball sampling approach was adopted to recruit undergraduate students from eight publically-funded universities in Hong Kong, including The Hong Kong Polytechnic University (PolyU), The University of Hong Kong (HKU), The Chinese University of Hong Kong (CUHK), Hong Kong Baptist University (HKBU), City University of Hong Kong (CityU), The Education University of Hong Kong (EdUHK), Lingnan University (LU), and Hong Kong University of Science and Technology (HKUST). With the assistance offered by the coordinator in each university, the link of online survey was issued to students who had shown willingness to join the study. Students were well informed of the principles of confidentiality and their rights to withdraw from this study at any time. A local supermarket voucher worth \$HK100 dollars was offered to each participant who completed the whole survey as an incentive.

Table 4. Confirmatory factor analysis loadings

Item	Factor loading	Item	Factor loading
Vision and competence 1	.67	Caring disposition 6	.67
Vision and competence 2	.66	Caring disposition 7	.69
Vision and competence 3	.70	Ethical role model 1	.71
Vision and competence 4	.74	Ethical role model 2	.80
Vision and competence 5	.74	Ethical role model 3	.76
Vision and competence 6	.62	Ethical role model 4	.67
Vision and competence 7	.67	Ethical role model 5	.66
Vision and competence 8	.72	Social competence 1	.73
Vision and competence 9	.68	Social competence 2	.74
Vision and competence 10	.61	Social competence 3	.76
People orientation 1	.61	Social competence 4	.73
People orientation 2	.63	Self-Understanding and reflection 1	.50
People orientation 3	.72	Self-Understanding and reflection 2	.71
People orientation 4	.69	Self-Understanding and reflection 3	.79
People orientation 5	.75	Self-Understanding and reflection 4	.76
People orientation 6	.68	Self-Understanding and reflection 5	.73
People orientation 7	.71	Positive view about human beings 1	.76
People orientation 8	.63	Positive view about human beings 2	.71
Caring disposition 1	.70	Unchangeable and dark human nature 1	.76
Caring disposition 2	.71	Unchangeable and dark human nature 2	.85
Caring disposition 3	.60	Unchangeable and dark human nature 3	.67
Caring disposition 4	.72	Unchangeable and dark human nature 4	.35
Caring disposition 5	.72	Unchangeable and dark human nature 5	.50

The data were collected between late March and early June 2017. After excluding 6 students who refused to give a formal consent, 33 students who had a record of completing the survey for multiple times, and 30 students who reported they were postgraduates, the final sample consisted of 4,486 undergraduates whose data were used to perform normative analyses. The normative sample was aged between 15 and 34 years old ($M = 20.47$, $SD = 1.67$), comprised of 2,969 (66.18%) female students and 1,517 (33.82%) male students.

Table 5. Percentiles and related raw scores for SLA-SF-46 (full scale) by gender

Percentile (1-50)	Raw Score				Percentile (51-99)	Raw Score		
	Male	Female	Full sample			Male	Female	Full sample
1	≤ 136.00	≤ 164.00	≤ 155.00		51	214.00	218.00	216.37
2	155.00	173.40	165.74		52	214.00	218.00	217.00

50	20.00	20.00	20.00		100	24.00	24.00	24.00

Note. $N = 1,517$ for male sample, $N = 2,969$ for female sample, $N = 4,486$ for full sample.

Normative Statistics

Norms for full sample and subgroups (i.e., male and female groups) were calculated. Due to non-normalized distribution of the raw scores in the full sample and sub-groups, percentile ranks instead of standardized Z scores were provided. A total of 18 norm tables (Tables 5-22) are presented in the manual. While Tables 5 and 6 demonstrate norms of total score of the full scale, Tables 7-22 are norm tables for the eight sub-scales. For both full sale and sub-scales, percentile ranks and corresponding raw scores (Tables 5, 7, 9, 11, 13, 15, 17, 19, 21) as well as each raw score and its equivalent percentile rank (Tables 6, 8, 10, 12, 14, 16, 18, 20, 22) are presented, for the full sample and the two sub-groups.

Table 16. Raw scores and related percentiles for SLA-SF-46 (Factor 5) by gender

Raw score (≤ 15)	Percentiles			Raw score (16-21)	Percentiles			Raw score (22-24)	Percentiles		
	Male	Female	Full sample		Male	Female	Full sample		Male	Female	Full sample
10	1.0	1.0	1.0	16	9.0	4.0	6.0	22	77.0	71.0	73.0
11	2.0	1.0	1.0	17	14.0	8.0	10.0	23	87.0	82.0	84.0
12	2.0	1.0	1.0	18	21.0	12.0	15.0	24	100.0	100.0	100.0
13	3.0	1.0	2.0	19	30.0	17.0	22.0

12	27.0	21.0	23.0	21	87.0	85.0	85.0	30	100.0	100.0	100.0
13	33.0	28.0	29.0	22	91.0	90.0	90.0				

Note. $N = 1,517$ for male sample, $N = 2,969$ for female sample, $N = 4,486$ for full sample.

SCORING AND INTERPRETATION

The SLA-SF-46 has 46 items operating on eight content specific subscales. The score of each subscale is calculated by summing up the scores of respective items. The total score of

service leadership attitude is calculated by summing up the scores of all eight subscales. It has the property of having a minimum score of 46 and a maximum score of 276.

Handling of Missing Items

The satisfactory internal consistency is conditioned on that all items in a subscale or full scale have been completed. When there are missing values in any subscale, the responses should be interpreted with caution. The responses with missing value(s) should not be adopted for analysis or appropriate methods should be used for computing missing value(s) before doing further analyses.

Interpretation of Test Scores

Interpretation of SLA-SF-46 test scores can be based on the score of full scale or each subscale. The score of full scale shows how favorable the core value of contemporary service leadership is viewed by participant, while the score of each subscale reflects his/her perception of specific service leadership quality. For example, a high score of “ethical role model” subscale indicates a strong belief that a service leader must take a leading role in setting ethical standards.

As mentioned before, Tables 5-22 present percentile norms for the score of full scale and each subscale. Percentile rank scores represent the percentage of people in the normative sample (full sample or sub-samples) who scored at or below a particular raw score for a particular measure (full scale or subscales). In other words, a percentile rank score informs the relative position of one’s score in relation to his/her relevant group. For example, if a male college student wants to surpass 20% of his male peers in developing positive service leadership attitude, he needs to get at least 194 points (see Table 5). Likewise, if a male college student gets 214 points for full scale, he has already surpassed half of all male students (see Table 6).

When interpreting test scores, we do not intend to define a cut-off value for determining positive versus negative attitude toward service leadership. Thus, “positive attitude” and “negative attitude” are not suggested to be adopted to differentiate people with different attitude. Researchers or program evaluators may locate the score of a student into the norm tables to determine his/her comparative position regarding service leadership attitude, and use “less positive than the normative sample,” “similar to the normative sample,” or “more positive than the normative sample” to conclude different levels of service leadership attitude. Furthermore, when evaluating the effectiveness of a specific service leadership education program, evaluators are suggested to compare participants’ attitude scores obtained before and after they receive the program. In this case, mean scores could be used without making reference to the norm tables.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this chapter is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University.

ABSTRACT

The rapid development of service economies calls for validated tools measuring service leadership qualities. In view of the dearth of measures of leadership behaviors in the service economies, the Service Leadership Behavior Scale was developed to assess service leaders' leadership skills and practices based on the Service Leadership Theory, which defines effective leadership behavior in service economies. With an initial item pool of 97 items, the final scale was trimmed to 38 items after several validation studies, which demonstrated very good psychometric properties. In this chapter, we briefly introduce the background of the development of the Service Leadership Behavior Scale and its related conceptual framework. In addition, validation process, reliability and validity of the scale, norm statistics, and guidelines for administering the scale and interpreting scores are outlined as well.

INTRODUCTION

In recent decades, there is rapid development of the service sector in industrialized economies worldwide [1]. Service economy has become the leading contributor to local GDP in many countries and areas. For example, Hong Kong is regarded as a highly developed service economy with a significant portion of service sector contributing to the local economic development. It is argued that the prosperity of Hong Kong fundamentally relies on the success of the service sector [2].

The growth of service economy calls for strong leadership to adjust organization to respond to turbulent and complex environments. Among the various leadership models, service leadership has attracted increasing attention in response to a call for more ethical and people-focused leadership style associated with the rise of the service economy. According to Service Leadership Theory proposed by Po Chung [3], service leadership is about “satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one’s self, others, groups, communities, systems, and environments.” Service Leadership Theory is unique because it integrates three key attributes of effective leadership required by service economy: competence, moral character, and caring disposition.

To develop future leaders and citizens with service mindset and attributes qualities, the Victor and William Fung Foundation funded the Service Leadership Initiative in eight government-funded universities in Hong Kong from 2012 to 2015. To strengthen the assessment component of the service leadership education initiative, assessment tools have subsequently been developed and validated to evaluate service leadership attributes and the impact of service leadership education. In particular, three scales were developed to evaluate the attitude, knowledge, and behavior of students’ service leadership.

This manual introduces the development, validation, and usage of the finalized 38-item version of behavior scale (i.e., SLB-SF-38). It is useful for academics, practitioners, and researchers who are concerned about the evaluation of leadership behavior and the effectiveness of training programme aiming at promoting desired leadership behavior. This manual also provides evidence showing that the Service Leadership Behavior Scale is a reliable and valid tool. Normative data can be used for interpreting raw scores and group comparison. Some suggestions and directions of interpretation of the results are also discussed.

CONCEPTUAL FRAMEWORK

Based on the Service Leadership Theory and its unique propositions such as the emphasis on character and caring behaviors (i.e., not just leadership skills), the Service Leadership Behavior Scale was developed with reference to four fundamental areas as briefly outlined in the following paragraphs. Detailed elaborations can be found elsewhere [4, 5].

The first area is “service provision” describing an individual’s people- and service-oriented mindset of providing high-quality and personalized services. Effective service leaders are expected to be sensitive to others’ needs and be willing to transcend one’s own interests to satisfy the needs of others and society.

The second area is pertinent to key skills intrinsic for an effective service leader. In particular, effective service leaders possess not only “competence” but also “character” and “care” (i.e., the 3Cs). Competence includes both intrapersonal and interpersonal competence [6, 7]. Intrapersonal competence covers a wide range of human intellectual abilities related to processing information and understanding and managing oneself and others. Shek and Lin [6] highlighted four types of intelligence particularly reflecting intrapersonal competence, which include intelligence quotient (IQ), emotional quotient (EQ), adversity quotient (AQ), and spiritual quotient (SQ). In addition to intrapersonal competence, effective service leaders should also be capable of forming and maintaining positive relationships, collaborating and communicating effectively with people, and being assertive and solving conflicts in a constructive way. All these skills are considered interpersonal competence. Regarding the second C (i.e., character), a good service leader is expected to lead oneself and others with moral values that are universally upheld, such as integrity, humility, and fairness [8]. For the third C (i.e., care), it is argued that a good service leader should be a caring leader who cares about others’ interests and wellness in terms of showing empathy and compassion, loving others, being supportive, and helping others to have better development [9].

The third area is related to continuous improvement. Service Leadership Theory stresses that one should continuously improve oneself for better providing services to others and systems. To improve one’s competence and willingness to serve, an effective service leader should promote self-leadership through active self-reflection and life-long learning.

The last area highlights the importance of distributed leadership. First, a good service leader maintains shared decision-making by encouraging every teammate to voice out and take initiatives. Second, a quality service leader also respects their followers’ views and recognizes their contributions. Third, a good service leader is expected to trust his or her followers’ abilities and help them to maximize their potentials and grow to good service leaders as well.

DIFFERENT STAGES OF THE VALIDATION PROCESS

The Service Leadership Behavior Scale is one of the three assessment tools evaluating service leadership education and related leadership qualities. With the financial support from the Victor and William Fung Foundation, The Hong Kong Polytechnic University (PolyU) led the collaboration with other seven government-funded universities in Hong Kong for carrying out validation studies on the attitude, knowledge, and behavior scales of service leadership. To develop the behavior scale, several stages were involved in the process:

Stage 1: The original 97-item Long-Form Service Leadership Behavior Scale (SLB-LF-97) was developed with reference to the conceptual framework of the Service Leadership Theory.

Stage 2: A study investigating the content validity of SLB-LF-97 was first conducted [4]. Ratings from three experts suggested that the SLB-LF-97 has good content validity indexed by clarity, relevance, and representativeness of each item.

Stage 3: The SLB-LF-97 was further validated and streamlined through an initial validation study involving 231 university students [10]. According to the results of

exploratory factor analysis (EFA), 65 of the original 97 items were retained to form a short-form behavior scale (i.e., SLB-SF-65), which had a 12-dimension structure. The SLB-SF-65 demonstrated good reliability and convergent validity.

Stage 4: To further refine the behavior scale, a large-scale validation study ($N = 4,486$) was jointly carried out in the eight government-funded universities in Hong Kong. EFA based on a half-dataset ($N = 2,246$) suggested a new 48-item short form (SLB-SF-48) which consisted of six subscales [11].

Stage 5: Based on the other half-dataset ($N = 2,240$), a confirmatory factor analysis (CFA) was used to finalize the SLB-SF-48. Informed by CFA, 38 items were kept in the finalized behavior scale (SLB-SF-38), which also possessed a 6-factor structure. This finalized behavior scale and its six subscales showed good internal consistency and convergent validity. Detailed information is summarized in Section 5 of this manual.

DESIGN AND USE OF THE SCALE

Some items of the Service Leadership Behavior Scale were modified from existing scale items related to leadership behaviors [12, 13]. Other items were developed by the research team based on the conceptual framework and propositions related to Service Leadership Theory [14]. The six factors of the finalized behavior scale (i.e., SLB-SF-38) are described below:

- Factor 1: Self-improvement and self-reflection (9 items). A hypothetical sample item is “I have a habit of reflecting my work and life.”
- Factor 2: People and principles orientation (9 items). A hypothetical sample item is “I allow others to decide how to get things done.”
- Factor 3: Resilience (7 items). A hypothetical sample item is “I usually become stronger instead of weaker when facing adversity such as failures and setbacks.”
- Factor 4: Social competence (5 items). A hypothetical sample item is “I can maintain positive relationships with others.”
- Factor 5: Problem-solving (5 items). A hypothetical sample item is “I am good at independent thinking.”
- Factor 6: Mentorship (3 items). A hypothetical sample item is “I can facilitate other’s growth by mentoring them.”

Target Respondents

The SLB-SF-38 can be used to assess the service leadership behavior of university students or employees in different Chinese communities (e.g., Hong Kong, Taiwan, and mainland China). Noteworthy, local norms need to be constructed when the scale is used in a context other than Hong Kong, because the normative data reported in this manual were derived from a university student sample in Hong Kong.

Instructions

The SLB-SF-38 is administrated in a self-report manual in English. Formal written consent should be obtained from respondents. Instructions are outlined at the beginning of the questionnaire for participants to follow.

In general, respondents can complete the whole questionnaire without a specific time limit. On average, a respondent can complete the scale within 15-20 minutes. In principle, participants should return the completed questionnaire to test administrator. Taking the questionnaire out of the administration venue is not normally allowed.

Administration Guidelines

The test administrator should observe the following principles:

- 1) Respondents should complete the questionnaire independently. Discussion and communication on scale items among participants are not allowed.
- 2) Field administrators can give explanations on grammars or meaning of scale items if respondents have difficulties in understanding any specific words or phrases. However, respondents need to complete all times based on their own understanding.
- 3) In addition to full-scale, subscale(s) can be used independently if all items of the subscale(s) are included without any omission.
- 4) The same rating scale (i.e., 6-point Likert scale) should be used.
- 5) SLB-SF-38 can be administered using paper-and-pencil or online questionnaire. If paper-and-pencil administration is applied, the completed questionnaire should be collected by testers on-site in a confidential manner.

RELIABILITY AND VALIDITY

The reliability and validity of SLB-SF-38 were investigated in the aforementioned large-scale validation study using a normative sample ($N = 4,486$) [11, 15]. Related findings are briefly outlined below.

Internal Consistency/Reliability

SLB-SF-38 and its six subscales demonstrated good internal consistency. Cronbach's alphas of the full-scale and subscales ranged from .85 to .96. The mean inter-item correlations across scale/subscales ranged between .38 and .65 (see Table 1).

Table 1. Internal consistency of SLB-SF-38 and its subscales

Scale/subscale	No. of items	Cronbach's alpha	Mean Inter-Item Correlations
Self-improvement and self-reflection	9	.91	.53
People and principles orientation	9	.87	.42
Resilience	7	.87	.50
Social competence	5	.86	.55
Problem-solving	5	.87	.56
Mentorship	3	.85	.65
Full scale	38	.96	.38

Convergent Validity

SLB-SF-38 showed good convergent validity. First, the full-scale and its six subscales significantly correlated with each other (see Table 2). Second, as shown in Table 3, there were significant correlations between full-scale/subscales and the eight external criterion scales (e.g., the knowledge and attitude to service leadership, moral self-concept, and leadership efficacy).

Table 2. Inter-factor correlations of finalized behavior scale/subscales

	F1	F2	F3	F4	F5	F6

Factorial Validity

Results of CFA based on the normative sample ($N = 4,486$) suggested a good fit of the 6-factor structure of SLB-SF-38 ($CFI = .91$, $TLI = .90$, $RMSEA = .055$, $90\% CI = [.054, .056]$). As shown in Table 4, factor loadings were between .51 and .86.

More detailed findings of different validation studies aforementioned can be found in publications on the background and conceptual model of the scale [5], content valuation [4], the initial validation study [10], factorial and convergent validity of SLB-SF-48 based on EFA [11] and a manuscript in preparation which attempts to report findings of CFA and psychometric properties of the finalized behavior scale (SLB-SF-38). Additionally, percentile norms and personal correlates of service leadership behavior regarding the full scale of SLB-SF-38 have also been presented by Shek and collaborators [15]. Norms of SLB-SF-38 with reference to the full scale and its subscales will be outlined in the following section.

Table 4. Confirmatory Factor Analysis loadings

Item	Factor loading	Item	Factor loading
Self-improvement and self-reflection 1	.73	Resilience 2	.71

People and principles orientation 8	.63	Mentorship 1	.75
People and principles orientation 9	.65	Mentorship 2	.86
Resilience 1	.62	Mentorship 3	.82

NORMS

The normative sample involved in this manual was obtained through a snowball sampling strategy in the aforementioned large-scale validation study. First, PolyU initially set up an online survey and distributed the link to the coordinators in other seven participating universities in Hong Kong. Second, the coordinator in each university invited undergraduate students to respond to the online survey. Student participants were well informed of several important principles, such as confidentiality, anonymity, and freedom to withdraw. After completing the questionnaire, each participant was given a local supermarket voucher worth HK\$100 as an incentive.

The final normative sample of 4,486 undergraduate students was recruited from late March to early June 2017. The age of participants ranged between 15 and 34 years ($M = 20.47$, $SD = 1.67$). Among these participants, 2,969 (66.18%) were female students and 1,517 (33.82%) were male students.

Normative Statistics

The raw scores of full-scale and sub-scales obtained from full sample and gender-specific samples were non-normative. Therefore, norms of percentile rank of the score of full- and sub-scales instead of standardized Z scores were calculated for full sample and gender-specific samples. Related norm tables are presented in Tables 5-18. While Tables 5 and 6 show norms of total score, Tables 7-18 demonstrate norms of the six subscales in SLB-SF-38. For both total score and scores of subscales, percentile ranks (1-100) and corresponding raw scores are summarized in Tables 5, 7, 9, 11, 13, 15, and 17. Raw scores and related equivalent percentile ranks are outlined in Tables 6, 8, 10, 12, 14, 16, and 18.

Table 5. Percentiles and corresponding raw scores of Service Leadership Behavior Scale (SLB-SF-38) by gender

Percentile (1-50)	Raw Score			Percentile (51-99)	Raw Score

9	10.0	10.0	10.0	14	64.0	65.0	65.0				

Note. $N = 1,517$ for male sample, $N = 2,969$ for female sample, $N = 4,486$ for full sample.

SCORING AND INTERPRETATION

The SLB-SF-38 includes 38 items grouped into six subscales. The score of each subscale is calculated on the sum of each item of the subscale. The total score of service leadership behavior is calculated by adding up the scores of all 38 items. Theoretically, the total score ranges between 38 and 228.

Handling of Missing Items

Satisfactory reliability of the scale/subscales largely depends on participants’ responses to all items included in the scale/subscales. If there is missing value in any item, the results should be interpreted with cautions. Cases with missing value(s) should be excluded from data analysis or handled by appropriate missing value imputation methods before conducting data analysis.

Interpretation of Test Scores

Test scores of SLB-SF-38 can be interpreted in terms of a total score of full scale or test score(s) of subscale(s). The total score represents an individual's overall behavioral characteristics with reference to service leadership. The score of an individual subscale shows one's leadership practice and related skills in one specific area. For example, a high score of "Resilience" reflects one's capability of using effective strategies to overcome adversity and bounce back.

Tables 5-18 show norms of percentile ranks for the scores of full scale and the subscales. The percentile rank of a particular raw score represents the percentage of people in the normative sample scored no higher than this raw score. In other words, a percentile rank can be interpreted as one's relative standing in the relevant group according to the score. For instance, if a female university student wishes to surpass 50% of her female peers in demonstrating resilience, she has to get at least 30 points (see Table 11). Similarly, if a university student, regardless of gender, gets 31 points for subscale of resilience (i.e., Subscale 3), he/she has already surpassed 53% of all university students (see Table 12).

There is no specific cut-off value to define effective/good versus ineffective/bad service leadership behaviors. Therefore, testers are not recommended to describe people with different service leadership behaviors using objectives such as "effective," "good," "ineffective" or "bad," although norm-referenced descriptors may be used. For instance, scale users are suggested to locate a participant's test score in the norm tables to determine his/her relative position regarding service leadership behavior. Descriptions like "less effective than the normative sample," "similar to the normative sample," or "more effective than the normative sample" can be adopted to differentiate people with different service leadership behaviors.

In addition, when using the scale/subscales to examine the effectiveness of service leadership training programmes, evaluators are suggested to monitor the improvement through the comparison between pre- and post-test. In this case, using mean scores provides more meaningful information than referring to the norm tables does.

ACKNOWLEDGMENTS

The validation project is financially supported by the Victor and William Fung Foundation. The preparation for this chapter is supported by the Foundation and the Endowed Professorship in Service Leadership Education at The Hong Kong Polytechnic University.

Chapter 148

ORIGIN, DEVELOPMENT AND ASSERTIONS OF SERVICE LEADERSHIP THEORY

ABSTRACT

In response to the emergence of service economy in different societies, there is a need to rethink what effective leadership is in this changing landscape. With his expertise and success in courier service, Po Chung (the former CEO of DHL International) proposed the Service Leadership Theory (SLT) which posits that successful leadership in the era of service economy is governed by 3Cs – competencies, character and care. Through a qualitative study via analyses of the written work of Po Chung and personal interviews with him as well as his former colleagues, we document the chronology of the development of the Service Leadership Theory with reference to a) why he proposed the theory; b) the major milestones in the development of the SLT; and c) emphases of the SLT. The findings are discussed with reference to the leadership models and research in the scientific literature.

INTRODUCTION

Over the past few decades, the service sectors across the world have shown dynamic and fast growth, propped by the rise of a variety of service industries such as IT, e-commerce, communications, wholesale and retail trade, consultancy, and education [1]. In Hong Kong, the service sector has taken up as much as 92% of its GDP in 2017 [2]. The decline of manufacturing industry and the expansion of service industry have brought about far-reaching

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

impact on employment, division of labor and social relations. A manufacturing economy is characterized by the transformation and utilization of materials, with mechanized production of commodities [1]. Those commodities are very often tangible and standardized. In addition, workers in the production line are expected to operate machines and equipment to perform their specific tasks routinely without much input from their own (i.e., doing things right). The production processes, therefore, can be easily automated to ensure a higher level of productivity and efficiency [3, 4]. In contrast, service industries involve the provision and production of intangible goods, such as knowledge, information, advice, and experience, which are not mass-produced and must be tailored to customers' needs with the input from the service providers [1, 5]. Employees in the new era are thereby expected to be more skilled, knowledgeable, innovative and autonomous, and can gain intrinsic satisfaction from their work [3, 6]. Besides, providing quality service is much related to the moral standards and care of the service providers (i.e., doing the right things).

Due to the structural transformation of the societies, the demands of leadership have also been changed [7]. Characteristics of leadership in manufacturing industry include a clear-defined hierarchy, top-down management, centralized authority, bureaucracy and regulations [8, 9]. However, organizations and companies that over-emphasize leadership competencies and management skills would lose sight of the importance of moral character and caring dispositions [8]. On the other hand, due to the dynamics and complexity in service economies, employees are now yearning for flexibility and autonomy at work, and leaders play a vital role in empowering and motivating followers to develop capacity and achieve personal growth [3]. Accordingly, leaders are no longer assumed at the central position. Instead, the new vision of leadership emphasizes mutual influence between leaders and followers, with the decision-making process becoming a collaborative and shared process [6, 9]. Besides, in view of the mental problems faced by young people [10], there is a need to strengthen the psychosocial competence and inner strengths of service leaders.

The pivotal role that higher education plays in preparing future leaders for a society has been recognized by many researchers [11, 12]. In university leadership programs, there has been a growing quest for leadership competencies, such as communication and negotiation skills [13], critical thinking ability [14], global vision [15], etc. However, the current university leadership education has been criticized for its inadequate impact in nurturing future leaders that the coverage in cultivating service mindset and civic awareness is limited [12, 16-18]. The weight placed on skills development by many university leadership programs reflects that they still espouse beliefs of an industrial paradigm [19]. Therefore, university leadership programs need to revise the curriculum so as to meet the demands of the postindustrial era that emphasize service mindset, relationships, trust, ethics, etc. [19, 20].

As a service-oriented society, Hong Kong also calls for a transformation in leadership education [8]. In response to this development, the Hong Kong Institute of Service Leadership and Management (HKI-SLAM) was established in 2011. Headed by Po Chung, the founder of DHL International (Hong Kong) Ltd, this institute represents an effort to promote the principles and values of service leadership and facilitate practices in education, business and government sectors in Hong Kong. With financial support from the Victor and William Fung Foundation, HKI-SLAM launched the Li and Fung Service Leadership Initiative (SLI) to support service leadership education in the eight UGC-funded universities in Hong Kong [21]. The eight universities financed by UGC have all developed service leadership programs and incorporated them into the curriculum.

Obviously, the development and implementation of universities' leadership programs give rise to the need for evaluation of its effectiveness in developing leadership. [22]. Against this background, Shek and his colleagues carried out a series of large-scale quantitative studies that drew on validated assessment tools to measure the effectiveness of the service leadership programs [8, 23-24]. For example, in Lin and Shek's [23] pretest-posttest quasi-experimental study, researchers used measures that had been validated in their previous studies, such as the Chinese Positive Youth Development Scale [24, 25], to examine the effectiveness of a service leadership program in Hong Kong. They found that students who took the service leadership course (experimental group) showed greater improvements in terms of leadership knowledge, attitude and life satisfaction than students who did not take the course (control group). The findings also showed that students' leadership development contributed to their well-being.

Alternatively, a few studies turned to qualitative evaluation which examined students' subjective perspectives and views towards the service leadership courses [20, 26]. Most findings demonstrated that students perceived the courses positively and considered the participation conducive to their holistic development. For example, Shek and Lin [20] conducted a qualitative evaluation on a non-credit-bearing service leadership program in Hong Kong. Participating students were invited to describe their perception of their experiences by using three descriptors and one metaphor. Results indicated that over 90% of both the descriptors and the metaphors were positive in nature. In general, both quantitative and qualitative evaluation studies provided compelling and consistent evidence that participation in those programs contributed to service leadership development, which also confirmed that service leadership could be nurtured in tertiary education.

With much research concentrating on evaluating program effectiveness, several questions concerning the Service Leadership Theory proposed by Po Chung remain unanswered. For example, what prompted Po Chung to conceive a leadership model in the first place? What are the milestones in the development of the model? How do the major changes intertwine with each other against a broader background of social and economic transformation? To answer these questions, we seek to explore the chronology of this theory, as a study of chronology unfolds the causes and effects of events in the process and deepens our understanding of the interdependence and interconnections of the events in the topic under focus [27]. To be specific, the present study attempted to contribute to the knowledge about the development of the SLT by looking into the chronology of the theory and milestones in the process with reference to three guiding questions:

- a. How has the SLT evolved (i.e., chronology)? What are the major milestones in developing the SLT?
- b. Why did Po propose the SLT?
- c. What are the key propositions of the SLT?

OUR STUDY

Given the nature of the above-mentioned research questions, a qualitative approach was considered more appropriate for the current study, as it allows for a deep understanding of the

complex social world and attends to the intricacy in people's lives [28-29]. Situated in qualitative approach, narrative inquiry is a methodology that pays close attention to people's life stories over time, where researchers gather valuable information through people's storytelling [30]. It allows researchers an opportunity to make an in-depth inquiry into people's voices, thoughts and behaviors, as well as how they make sense of their world [31]. In addition, narrative inquiry can work with a variety of data collection methods to elicit data of the subjective experiences such as autobiographical writing, journal writing, interviews and observation [32]. As stated previously, the present study intended to probe into Chung's personal journeys and his colleagues' experiences to explore the chronology of the SLT and the critical steps in the process.

In the current study, autobiographical writing and semi-structured narrative interviews were adopted as the major inquiry tools. The data were collected between October 2019 and May 2020, which involved Chung's autobiographical writing, followed by five interviews with Po Chung and two group interviews with Chung's colleagues. The autobiographical writing provides an initial inquiry into Chung's personal journey and a context for the ensuing interviews. Chung was invited to write about his experiences based on the prompts we sent to him beforehand. The autobiographical writing was about Chung's stories related to the origin and development of the SLT.

Regarding the following interviews, the open-ended nature of the semi-structured interviews allows for some flexibility during interviews whereby the researchers can further probe for details while it also enables the interviewees to express themselves freely [33]. Individual interviews were conducted to elicit data on the evolvement of the SLT, the milestones of the theory such as competence, character, care and self-leadership, as well as the future of service leadership. Each interview was based upon the previous one in order to get a deeper understanding of the topic. For example, Chung mentioned in the first interview that he had developed the initial sense of leadership from the elementary school education, which contributed to the construct of the SLT in his later stages of life. In the second interview, we followed up on how his family imbued him with leadership awareness in his childhood in order to obtain a more in-depth understanding of how his family upbringing contributed to the development of SLT.

Based on Chung's recommendations, we contacted his colleagues to invite participants for the group interviews. Two colleagues voluntarily participated in the two group interviews. The focus of the group interviews was to elicit the informants' experiences of how DHL incorporated the SLT into practices and how the development of the theory was reflected in its management. Each of the seven interviews lasted for approximately one hour.

Data Analysis

All interviews were recorded and transcribed. As some interviews were conducted in Cantonese, the transcripts were translated into English before the analysis. Thematic analysis was used in the data analysis as it plays a critical role in categorizing data, identifying themes and facilitating high-order thinking in qualitative research [34]. We first singled out the meaningful parts relevant to each of our three research questions, and identified codes and preliminary themes. Following a cyclical process, those codes and preliminary themes were

revisited, reworked and refined in alignment with the research foci and questions. The codes were then peer checked by two other researchers to maintain the credibility of the data analyses and conclusions drawn. After the revision and finalization of codes, the coding files were then sent to the informants for the purpose of member checking.

Drawing upon the evaluation of a database of qualitative evaluation studies, Shek and his colleagues [35] identified several principles that qualitative researchers should have awareness concerning the issue of quality. We applied the principles in examining the quality of the present study. First, they [35] argued many qualitative studies used the term *qualitative* in a vague manner and failed to specify the qualitative approach. In response, the present study focused on narrative inquiry as to the methodology. Second, we also upheld the principle of auditability in which sufficient details of data collection procedures were provided as above, including that we adopted continuous interviews for data collection. Third, in order to increase the overall “reliability and validity” they called for, the present study adopted peer checking and member checking to assess accuracy and adequacy of the data, and allowed alternative interpretations in the analysis.

THE CHRONOLOGY OF SLT

The chronology is summarized in Figure 1 based on the collected data and writings of Po Chung [3, 21, 36-39].

Initial Sense of Leadership Developed in Childhood

It was made clear from Chung’s autobiographical writing that his initial sense of leadership was shaped by the joint effort of both family and school education. His father who worked for a tobacco company as a manager and led hundreds of coworkers was his role model. Explicitly or implicitly, his father inculcated the values of leadership in him, such as altruism, caring and respecting others. As Chung recalled in the first interview, his father constantly reminded him that being a good person and leader “you have to take care of colleagues. So, don’t do things that are only selfish, but (those you) really have to do.” Later, Chung and his family moved to Macau, and they lived with the subordinates of his father. Although lives were hard, they looked after and took care of each other from the heart. The experience made him understand the importance of building human relationships and networks.

Chung received his elementary education at St Stephen’s College, and the setting of “perfect” in school inspired him in the development of SLT. In Hong Kong schools, some well-behaved senior students with excellent performance in academics or sports would be selected by teachers as “perfect” and were treated as role models for other students to learn from. By observing the behavior of the prefects, Chung found self-management not just critical to personal growth and self-improvement, but it also helps in earning trust and respect from others. He shared in the interview:

“So St. Stephen is a Christian boarding school... In this boarding school, we had things called ‘prefect’... So in the old school, the senior class, we had six people that are chosen to be models of other students...This is where we learned how to behave as ourselves...After you learn how to behave, you have the values. You have the behavior. Then you get the respect and the trust of the rest of your schoolmates...And that’s where we learned self-management, and self-management became part of self-leadership...” (The first interview with Chung)

Chung accounted his early schooling and family upbringing with Christian values provided a positive context to him in developing the initial sense of leadership qualities, such as self-management, selflessness, care, respect, trust, etc.

Leadership Values Practiced at DHL

As a co-founder of DHL International, Chung brought those leadership qualities with him along the way and ingrained them into the managerial philosophy of the organization. For example, he highlighted mutual trust and respect between employees and the company:

“We know that if other people who work for us, there’s no trust or there’s no respect, and if we don’t give them the dignity of being a human being, they would not trust us, they would not respect us.” (The first interview with Chung)

The interview narratives from the DHL colleagues echoed Chung’s vision on trust and how it served as the cornerstone in maintaining global business:

“What has been established in DHL culture since a long time ago is trust, the unbelievable trust between colleagues...When I have received an urgent parcel in Hong Kong, I will trust my colleagues in the US to deliver it to (US)... I won’t worry about it because he will get this right, and vice versa...Trust was deeply rooted in our mindset...When I promise others, no matter this task is from the US or Taiwan, as long as I take the request and make the promise, I will try my best. I won’t let you down.” (The second interview with DHL staff)

Based on the belief of trust, DHL used a “master and apprentice” system to impart skills and wisdom that is similar to the “perfect system. In this system, employees demonstrate their self-management ability, and they are encouraged to observe and learn from the supervisor and continuously improve themselves. At the same time, they were also granted autonomy to make decisions, carry out those decisions, and learn from their mistakes. Chung explained:

“We use a ‘master and apprentice’ system. And when we finish teaching them the master skills, they become masters...So what we teach them is autonomy, being able to make the best decision, being the best version of himself as a courier, (the) best version of himself as a supervisor, best version of himself as an assistant manager. That’s what we try to do.” (The first interview with Chung)

“Push decision to the lowest level... A courier goes on a street. Every street is different. Every country is different. Every city is different. So, if you don’t let him make decisions, he will never learn. He will do the minimum because he does not dare to do anything creative.” (The second interview with Chung)

Theory Development (5 Dynamics of Entrepreneurship Model)

After the retirement from DHL, Chung began teaching entrepreneurship at universities in Hong Kong, which started his journey of “collecting, researching, deconstructing and explaining what (he) experienced as an entrepreneur” (Chung’s autobiographical writing). This experience prompted him to think about the defects of the present leadership education and models and why they failed to address the needs of our service-oriented economy (This part will be elaborated in the next section, i.e., “Why Chung proposed SLT”). Chung then worked with a group of entrepreneurs to conceptualize entrepreneurship and developed the “5 Dynamics of Entrepreneurship” framework (5D Model). It represented his initial attempt to develop a leadership model:

“One major stage for advancement happened from 2004-2005, when Saimond Ip, Leonard Lane, Thomas Osgood and I designed the 5 Dynamics of Entrepreneurship model. This began the formal articulation of a character-driven leader at the heart of a start-up.” (Chung’s autobiographical writing)

The center of the 5D Model is the entrepreneur’s personal operating system (POS) which stated the qualities of entrepreneur to get the startup off the ground in an uncertain and competitive environment [37]. Notably, the value of character strengths is articulated and underscored in this model. Chung also held the belief that the five entrepreneurial dynamics could be taught [37].

Establishment of Hong Kong Institute of Service Leadership and Management (HKI-SLAM) and Theory Development

Both the writing and interview narratives revealed Chung’s vision of promoting more service-centric leadership to meet the demands of our service-oriented society. This vision, together with his educational and career trajectory, guided him in taking the lead in the establishment of HKI-SLAM in 2010. According to Chung’s autobiographical writing, he worked with Ran Elfassy from 2012 to 2013, during the period they identified the 12 dimensions concerning the desirable traits of a service leader [38]. The 12 dimensions are grouped into four facets, i.e., doing, being, thinking and growing [38]. Through what Chung called “pattern recognition,” SLT was further developed into a 3Cs model where competence, character and care were recognized as the three major principles in establishing effective service leadership:

“I seem to have ability to look at a whole group of things and then group them together. So, this one and this one (are in) one group; this and this in one group; and this is another group. So, that’s pattern recognition.” (The second interview with Chung)

This service leadership model was then fully developed by HKI-SLAM to boost service leadership education and practices [36]. In this model, service leadership was clearly defined as “a service aimed at ethically satisfying the needs of one’s self, others, groups, communities, systems, and environments” and conceptualized with 7 core beliefs [21].

Fung Service Leadership Initiative for Eight UGC-Funded Universities in Hong Kong

Sponsored by the Victor and William Fung Foundation, the Fung Service Leadership Initiative was launched in 2012 to promote sustainable service leadership education at the higher education levels in Hong Kong. From Chung's perspective, university education was gatekeepers of legitimate knowledge and values, and hence could serve as an incubator for cultivating future leaders. This perspective was also embraced by many previous educators [11, 12] who recognized the mission of Higher Education Institutions (HEIs) to inspire future leaders.

Despite the initial skepticism, the eight UGC-funded universities gradually endorsed service leadership philosophies and embraced the idea of incorporating the SLT in their curriculum:

"We went to (the) eight universities and we faced a lot of skepticism in the beginning, but now it's mostly accepted by all eight universities. Why we went to (the) eight universities? Why we went to universities? Because those are the gatekeepers of values or gatekeepers of knowledge...But now, nobody resists it anymore. EdU does it. PolyU is teaching it. BU is teaching it, and Lingnan is; all of them are doing it." (The second interview with Chung)

The promotion of service leadership education involves two non-mutually exclusive strands: One is to acquire the concepts and philosophies in the SLT, and the other is to engage students in experiential learning where students can practice their leadership and achieve personal development. With the support from the Fung Service Leadership Initiative, PolyU was among the first batch that introduced to its undergraduates a credit-bearing course entitled "Service Leadership" in 2012/13 academic year:

"We can see two sides of leadership service; one is called service learning or service doing. That's more like the lab, the practical. It's like teaching chemistry - there is a theory side, and this is what we are...and there's a practice side that we organize students to go out and do the service. Before, some universities only have the lab. We gave the theory and now they are merging it together. EdU is definitely doing that. You guys are doing it. PolyU is doing it because there is another team that goes out and says, 'You go to Cambodia. You go to Vietnam.'" (The second interview with Chung)

WHY CHUNG PROPOSED THE SLT?

Gaps between What the Schools Teach and What Societies Need

From the above excerpts and illustration of the chronology of the SLT, we can see that Chung's leadership awareness was nurtured by the upbringing and reinforced by the successful implementation at DHL. However, it was his experiences of teaching university students entrepreneurship that motivated him to think about conceptualizing leadership and promoting leadership education that meets the demands of the time. In his opinion, our society has undergone a tremendous shift from manufacturing-oriented to service-oriented economy. The former society was characterized by industrial production of tangible goods

while the latter is featured by business or customer orientations and the production of intangible values:

“So, we were shifting from manufacturing to service...There were no factories anymore and put people out of work. Because there were no more factories, we had to train (and) retrain 200 thousand people from manufacturing to service, and I was one of them.” (The second interview with Chung)

“Then, we have to move on to the post-industrial age. We are in the post-industrial age because the making of things is over, because AI is coming, and we have to be more human to lead other humans. So we are changing from making things to motivating humans to do better things so that humans can become better.” (The first interview with Chung)

However, his university lecturing experiences made him realize the gap between what schools were teaching and what the current society needed. From his keen observation and research, schools stressed and valued students’ skills and knowledge rather than their character and caring disposition, which largely aligned with an industrial manufacturing mindset:

“MBA is all about skills. It’s all about skills. It’s all about knowledge, but very little on character and care.” (The second interview with Chung)

“(After lecturing at universities,) it was clear that there was a gap in mindset between what the schools were teaching and what companies needed. After my team and I surveyed what was being taught at the MBA schools, it dawned on us that the ideology was driven from an industrial manufacturing mindset. That was fine for overseeing production lines, but service was completely different!” (Chung’s autobiographical writing)

Chung further explained the rationale behind the over-emphasis of one C (competence) and neglect of the other two Cs (character and care), and he pointed out the setting is a sign of the times:

“One C (Competence) was logical. Many business schools in the US were sponsored by manufacturers, so they concentrated on getting more people who can do things right, but neglected (we should) do the right thing with the right heart.” (The third interview with Chung)

In contrast, a service-oriented economy underlines creating values for customers and the society while achieving self-fulfillment:

“To summarize, I clearly showed how management was designed for industrial manufacturing and making sure things are done well. This is crucial when a production line must produce millions of identical objects. High-level services, on the other hand, are complex exchanges between people that help one another thrive, be more fulfilled, and reach their whole self-actualization.” (Chung’s autobiographical writing)

Existing Leadership Models Fail to Address What the Societies Need

The weight casted on leadership skills and competencies was also mirrored in leadership theories and models. Many traditional leadership models entail a top-down notion, evidenced by the highlight of regulation, hierarchy, managerial skills and efficiency in the output [36]. Service leadership, as Chung argued, would be a complement to existing leadership models by giving considerable attention to the principles of character and care:

“All leadership models have their own advantages. Any leader who wants to succeed must keep learning and absorbing the essence in all areas. Rather than displacing other models, service leadership is a complement to other models that any leader should bear in mind if they really want to succeed and should put it in (the) first order.” (Chung’s autobiographical writing)

“Specifically, leadership programs and models are overly weighted on addressing the competencies, EQ and related facets of a leader. The Service Leadership model I designed, on the other hand, is most interested in helping a leader to improve their character through self-knowledge, self-governance and commitment to continuous learning and development. To put it another way, the ultimate goal in self-actualization of a leader is helping everyone in his or her network meet all their needs, including their self-actualization.” (Chung’s autobiographical writing)

It can be drawn from the above quotes that Chung’s service leadership is also contrasted with several other models which may also adopt a follower-centric vision. For example, the transformational leadership proposed by Kouzes and Posner [40] also lays stress on collective interest and personal devotion as a leader. However, it fails to address the importance of continuous self-improvement as well as a balanced development of oneself and the collective [36].

In summary, the premise of service leadership was prompted by Chung’s understanding of the gaps between what schools taught as well as what existing leadership models addressed and what societies needed. This understanding was gained from collecting, deconstructing and scrutinizing his business and teaching experiences. The pivotal part of service leadership, as Chung succinctly put it in a statement, “it’s not only that you do things right. It’s you have to do the right things with the right heart” (The second interview with Chung).

WHAT ARE THE KEY PROPOSITIONS OF THE SLT?

Service Centric

Regarding the major differences that distinguish the SLT from other existing models of leadership, Chung condensed them into three dimensions in his autobiographical writing: a service-centric vision, highlighting character strengths in leadership, and the separation of management from leadership.

A service-centric vision places a premium on serving, motivating and empowering followers as well as oneself, reflecting the requirements of a service-oriented society:

“The largest difference is that we make a clear distinction that our model is service centric, one that is separated from industrial manufacturing. We see this blurring of operational aims (i.e., confusing a manufacturing operation as being similar to a high-value service one) as being of critical importance. This blind spot is one we are trying to address and correct.” (Chun’s autobiographical writing)

Notably, the SLT sets itself apart from Greenleaf’s [41] servant leadership which also upholds the belief that a leader is to serve. The SLT was not established on the premise that the needs of others outweigh the needs of self. Instead, it accents a concerted effort to address the needs of oneself, others and system [36, 42]. In addition, it underscores the value of self-leadership where one should continuously reflect on and motivate oneself, and improve his or her competence, care and character.

Emphasis on a Person's Character in Leadership

Character has been recognized as one of the key attributes of service leadership, along with care and competence. Chung believed that good characters are morally valued traits that steer people in the right direction and bind people together. Empirical studies have also provided evidence that good characters are robustly associated with school achievements, altruism, resilience and life satisfaction, etc. [43, 44]. Moreover, character strengths can be cultivated and promoted through school education [45]. However, as argued by Chung, the cultivation of character strengths was in a subordinate role in existing leadership models and leadership education:

“We have found a gross lack of training, discussion or investigation in the leader's character. We have noted how universities skimp on character education, and this oversight has created many problems on leaders that we would describe as ‘toxic.’ To put it using our 3-Cs of Service Leadership, other models are great for covering Competence and even Care, but Character has gone ignored for too long ... There are many examples of leaders who did very well or got far ahead with only one strong C. More importantly, there are many examples of bad or toxic leaders in history who lead followers on a wrong track or use corrupt practice for getting advancement and achievement.” (Chung's autobiographical writing)

“A good character is character that attracts people. Bad character is a character that repels people. And you find them repulsive. We call it repulsive.” (The first interview with Chung)

Separate Management from Leadership

SLT does not equate leadership with management. Management, in Chung's opinion, is attentive to top-down regulation, control and hierarchy in operation, and efficiency in the output. Those tenets are conceived as typical indicators for a manufacturing setting [46]. In a service economy, however, it is vital for leaders to adapt their leadership to service contexts. Service leadership, in particular, values the possession of character strength and caring dispositions [42]. Chung explicated that a service leader earned respect and trust from the followers by committing to their needs and helping them thrive:

“Our model carefully separates management from leadership. Management is all about operational efficiency, stability and excellence – in short, doing things ‘right’ or well. In our view, leadership is more about doing the right things with good intentions. This is about ensuring that what a company does is aligned with human values and needs, resulting in the greatest good for communities and stakeholders.” (Chung's autobiographical writing)

“Leadership is different from management, so a leader is different from managers. Management is more like top-down because the company pays the employee, so the employee has the obligation, and the employees feel that they would listen to their manager because they report to the manager. But leadership is different because your position makes you a manager, but it's your followers that make you a leader. So it's a kind of human-relationship instead of employment, he follows you because he can get something from you. So what's the reason for me to follow you? You are not paying me to follow you. I am voluntary, it is my will to follow you. So it's a human relation instead of an employment relation... So these are pulling forces.” (The first interview with Chung)

DISCUSSION

On reflection, we highlighted several unique features of the current study. First, this is a pioneering study documenting the development of the SLT from its infancy to the present development. Second, the analysis of its development was not decontextualized. On the contrary, we examined how the model developed from an embryonic status to its prosperity with particular reference to the service economy of Hong Kong. Third, the understanding of the topic is derived from an integration of the collected data and literature. For example, in order to gain a more comprehensive understanding of Chung's views of the defects of existing leadership models, we revisited relevant literature of other models such as the servant leadership [41] and transformational leadership [40]. This integration facilitates our understanding of how the SLT distinguishes itself from others.

On a theoretical level, this study adds to the literature by showing how the milestones of the SLT interweave with the trajectory of Chung as well as the social and economic transformation. It reveals the ways the SLT responds to the demands of Hong Kong, a service-oriented economy. By doing this, the present study demonstrates that the values and principles of the SLT can be both an epitome and impetus for a service society. Practically, this study reinforces the previous arguments [23, 47] that it is necessary for universities to shift the focus of leadership education from training competencies and skills to cultivating students' characters, disposition and moral senses. It also echoes the viewpoints that HEIs can work as an incubator for cultivating future leaders [11-12, 48]. Finally, it provides insights into the efforts that have been undertaken to promote this leadership model and incorporate it into university curriculum in Hong Kong, providing practical implications to wider contexts.

While this paper outlines the chronology underlying the development of the SLT, it has several limitations. First, the focus on Chung's autobiographical writing and interviews as the methodological techniques relies on his ability to honestly and accurately recall his previous experiences and behaviors, which could raise the issue of reliability and validity of the study [49]. Second, it would have elicited richer data if additional interviewees had been involved. For example, our understanding of the DHL practices in relation to the SLT values could have been deepened if more DHL colleagues had been included. Another possible limitation of the current study is a biased interpretation which is inherent to qualitative research [50]. This limitation should draw our particular attention, as our researchers are practitioners in the related field, and thereby the interpretations could be influenced by their own perspectives and compromise the objectivity of the research. In response, participating researchers conducted a series of procedures, including disciplined data collection, disciplined data analyses, peer checking and member checking to minimize the bias in the analysis and interpretation. In conclusion, we probed into the chronology of the SLT against the background of social and economic transformations. More research can be conducted to explore the future development of service leadership and the limitations of this model. For example, with the development of validated measures on service leadership and behavior [51, 52], we can further examine the impact of service leadership on the well-being of the leaders, followers, service recipients and the community [53].

ABSTRACT

Humanity is an essential component of effective leadership in service economy because human interactions play an indispensable role in providing high-quality services. Several theories highlighting the importance of satisfying human needs provide theoretical support for humanistic leadership in service economy. Based on interviews with Dr. Po Chung and his colleagues in DHL International, the present paper explores how the notion of humanity is put into leadership practice in the workplace and the outcomes associated with humanistic leadership practices. The qualitative findings were also integrated with previous empirical findings in the leadership literature. Both the narratives and leadership research strongly suggest that the element of humanity can be put into leadership practice in terms of developing followers, satisfying their needs, and empowering them, which further lead to positive outcomes at both individual and organizational levels.

INTRODUCTION

Along with the worldwide shift from manufacturing economy to service economy, more human interactions are involved during the inseparable processes of service provision and consumption. On the one hand, service values are co-created through effective interactions between customers and other partners, including employers and employees, as well as leaders and followers [1-3]. As such, satisfying customers' needs becomes one of the leadership goals. At the same time, employees are increasingly valued as "human assets" who are

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

capable to store and share knowledge in order to provide high-quality services and contribute to organizational success. Therefore, fulfilling followers' needs through motivating, engaging, and empowering them constitutes another important dimension of leadership behavior in service economy. Taken together, "humanity" or "fulfilling human needs" is the core of leadership practice in the service era (i.e., "Service leadership," SL) in terms of people orientation and service orientation [4].

SL represents a new paradigm that highlights empowerment and distributed leadership that values everyone's contribution in complicated decision-making processes involving different stakeholders, including customers, leaders, followers, and other agencies acquiring resources [5, 6]. SL also highlights a culture that entails organizations to achieve their promises, design their process, and engage their "human assets" in a proactive pursuit of service advantage [7]. In SL, capable leaders emphasize the satisfaction of followers' needs, cultivation of their internal motivation, and promotion of their personal development so as to maximize individual and team capacity and the attainment of organizational and even societal goals [8, 9].

These people-oriented and service-oriented beliefs about SL underscore the uniqueness of leadership in the service economy, suggesting that leadership practice is in fact a service provision process that can be performed by everyone and satisfy the needs of not only customers but also followers. However, existing leadership theories have not systematically incorporated these elements to guide leadership practice, education, and research in the service era. Against this background, Dr. Po Chung, co-founder of DHL International, established the "Hong Kong Institute of Service Leadership and Management" (HKI-SLAM) after his retirement and proposed the "Service Leadership Theory" (SLT) to promote service leadership practice and education in Hong Kong and abroad. Noteworthy, SL was defined as "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" [10].

The definition of service leadership itself reflects a strong emphasis on humanity by highlighting fulfillment of a wide range of needs, including one's own needs, such as self-serving efforts that improve individual competencies and willingness to provide high-quality services. Besides, SLT proposed that "3Cs" ("competence," "character," and "care") determine effective leadership in the service economy [11]. Competence refers to a service leader's skills and abilities to accomplish the job tasks, and more importantly, to inspire the followers to do the job well and help them improve. Character means that service leaders should demonstrate good morality so that they can ethically satisfy the needs of self, others, and society. Care refers to a leader's concern and respect for the benefits of others in leading people and providing services. These effective leadership qualities summarized by the 3Cs also highlight the importance of "humanity" (e.g., satisfying followers' needs by developing and respecting them) in service leadership practice.

The importance of humanity highlighted in the SLT is in line with different theoretical assertions addressing the importance of satisfying human needs, including the "self-determination theory" (SDT), "Maslow's hierarchy of needs" and the notion of "flourishing" in positive psychology. First, according to SDT that investigates intrinsic motivation and internal needs that drive people's behaviors, there are three inherent psychological needs, including autonomy, relatedness and competence [12, 13]. Satisfaction of these innate needs has been found to be closely related to positive outcome indicators such as vitality,

satisfaction of life and work, persistent performance, and secure attachment [14-16]. According to the SDT, effective service leaders are expected to satisfy followers' intrinsic needs in the workplace by enhancing their development, empowering them, and recognizing their contributions.

The second related theory is Maslow's hierarchy of needs, which conceptualizes human needs as a 5-tier hierarchy that includes physical needs (e.g., safety) at the basement two levels and psychological needs (e.g., love or sense of belonging, self-esteem, and self-actualization) at three higher levels [17]. These needs, especially psychological needs, play a crucial role in motivating people and securing positive development. Previous findings revealed that people might develop social anxiety or withdrawal from a group if they are not accepted or respected (i.e., lower self-esteem) or fail to form a sense of belonging [18]. Studies also showed that self-actualization reflects a good understanding of oneself and the development of one's potential, which enables one to acquire self-respect that others cannot take away [18]. Referring to the Maslow's hierarchy of needs, effective service leadership emphasizes the importance of satisfying human needs in the upper hierarchy in terms of fulfilling the needs of belongingness, self-esteem, and self-actualization of the followers.

The third psychological theory that provides support for the SLT is the concept of "flourishing" in positive psychology, which refers to "thrive, prosper, be in a period of the highest productivity or influences" [19]. This concept points to individuals' pursuit of well-being as a final goal [20]. To reach flourishing, there are five essential pursuits, including "positive emotion," "engagement," "relationships," "meanings" and "accomplishment" [20]. Once these psychological pursuits are fulfilled, flourishing and other positive outcomes, such as hopefulness, gratitude, empathy, and character strength, can be achieved [21]. Indeed, empirical evidence shows that these five aspects are positively linked to multiple indicators of well-being such as happiness, physical health, job satisfaction and life satisfaction [22, 23]. Therefore, from the perspective of flourishing, effective service leaders should help followers satisfy those key pursuits in order to achieve flourishing, which echoes the attributes of "3Cs" in effective service leaders. This also presents an approach to actualize humanity in service leadership.

According to the above-mentioned theories, satisfying followers' higher needs is of paramount importance in the workplace. As Jansen [24] stated: "work is no longer about completing tasks to make money for a company and its shareholders...It is also about you as an individual needing and wanting choices, meaning, rewards, motivation, and success in your work" (p. 236). Humanistic values and principles have also been discussed in existing leadership models. For example, Pirson and Lawrence [25] proposed a humanistic paradigm of leadership that emphasizes leaders' relational traits (e.g., viewing followers as individual human beings instead of merely resources to achieve intended outcomes). According to their paradigm, transformational leadership fits well the value of humanism as transformational leaders inspire, stimulate, develop, and engage followers and facilitate long-term relationships and commitment to the organization [26]. Hayat and Suliman [27] also differentiated between transformational leadership and transactional leadership with reference to humanistic values. While transactional leadership is based on a relationship of exchange between a leader and followers where only lower needs of followers (e.g., getting money) will be met, transformational leadership satisfies followers' higher needs by identifying their potential and converting them into leaders as well. In servant leadership [28], leaders also treat the followers and service recipients with humanistic principles.

Based on these theories, it can be argued that the emphasis on humanity in “Service Leadership Theory” has a solid theoretical basis. However, how “humanity” is practiced in actual leadership behavior and what the consequences are remain under-researched. To fill this knowledge gap, the present study attempted to uncover key practices in service leadership that reflect humanity and explore the outcomes of such humanistic practices. To achieve these two research objectives, the present study integrated previous empirical findings with data collected from interviews with Dr. Po Chung (Chairman of HKI-SLAM) and his two colleagues in DHL International.

INTERVIEWS WITH DR. PO CHUNG AND HIS COLLEAGUES

In order to have an in-depth and comprehensive understanding of humanistic practices in the workplace and associated consequences, a qualitative methodology was applied in the present study. Qualitative approaches have been widely employed in social science research as they allow people to express in-depth personal experiences and subjective feelings, so that researchers can have a better understanding of emotions, attitudes, behaviors, and experiences of humans [29, 30]. Among different qualitative methods, narrative inquiry focuses on participants’ stories and events that happened, from which researchers can have an in-depth investigation on participants’ voices, thoughts, and behaviors in a specific context as well as look into how the participants interpret their world and reality [31, 32]. Narrative research also provides a unique and contextual-based evaluation that reveals the occurrence of changes through a personal perspective [33]. Furthermore, narrative inquiry is workable with subjective data collected from different approaches such as autobiographical writing, storytelling, journal record, observation, and interviews [34].

In the present study, we attempted to understand humanistic leadership practices and consequences based on an integration of empirical evidence and individual experience of the key informants. Dr. Po Chung was the first key informant in the present study. The SLT emerged from leadership practices in DHL International, of which Dr. Po Chung was a co-founder. Besides, he is the Chairman of HKI-SLAM established to develop and promote SLT and leadership education. Considering the critical leading role of Dr. Po Chung in DHL International and HKI-SLAM, he is arguably the most important informant to provide insights into how the SLT is developed and how service leadership has been practiced in the workplace. In addition, Dr. Po Chung’s two colleagues (A and B), who had been under his leadership in DHL International for more than 25 years, were also invited to join the present study to provide more details on humanistic service leadership practices and consequences from employees’ perspectives.

Narrative inquiry was conducted by examining Dr. Po Chung’s writings and data collected from semi-structured interviews to underscore Dr. Po Chung’s and his colleagues’ personal views. Interview is a commonly used qualitative tool that can yield “insights into people’s perceptions, understandings and experiences of a given phenomenon and can contribute to in-depth data collection” [35]. Semi-structured interview with open-ended questions is a flexible approach that allows for deep discussion on planned topics as well as follow-up for unexpected answers or issues emerged during the discussion [36].

Data were collected between October 2019 and May 2020 from Dr. Po Chung's writing texts, five individual interviews with Dr. Po Chung and two group interviews with his colleagues. During the interviews, they were invited to share their observations and personal experiences toward different concepts and practices related to SLT, such as how the notions of humanity and 3Cs incorporated in SLT had been put into practice in DHL International and what the influences of these practices were with reference to the service economy. The humanistic practices and related influences in service leadership are the foci of the present study.

Upon Dr. Po Chung's and his colleagues' consent, all the interviews were audiotaped. A well-trained research assistant documented all interviews. Since Cantonese was the medium in some interviews, the transcripts were translated into English by the research team. The informants checked and confirmed the transcripts. All transcripts were analyzed through thematic analysis that is helpful in identifying and analyzing patterns and themes emerged from qualitative data [37]. Data analysis included five steps in the present study. First, an experienced researcher reviewed all data carefully and categorized informants' sharing into condensed summaries on the topic of "humanity." Second, the researcher further identified themes emerged from condensed summaries and merged conceptually similar themes into a broad thematic concept. Third, peer check for the coding was performed by two other experienced researchers in order to ensure the credibility of data analysis and conclusion eventually drawn [38]. Fourth, the responsible researcher further refined the structure and description of the themes based on peer check comments. Finally, the coding was sent to the informants for member checking. After this thematic analytic procedure, four themes related to "humanity" were confirmed. Details of each of them are outlined below.

THEME 1: LEADING PEOPLE IN SERVICE ECONOMY IS TO MOTIVATE AND DEVELOP THEM

In the industrial age where the operation system manifests itself as manufacturing tangible products, leadership mainly focuses on the management of production lines and processes, machines, and operation workers. In contrast, in the post-industrial age (i.e., service era), service provision involves more knowledge, skills, and human interactions. Thus, workers instead of machines serve as imperative assets of a service organization. Just as Chung [39] put it: "In manufacturing, people function as living robots. In service, in contrast, people are engaged to be, to think, and to feel like a person with the agency (the capacity of individuals to act independently and make free choices)." As a result, in service economy, motivating people and facilitating them to have a better achievement become an important agenda for service leaders in leading people. As Dr. Po Chung and his colleagues shared:

"We are in the post-industrial age because the making of things is over, because AI is coming, and we have to be more human to lead other humans. So, we are changing from making things to motivating humans to do better so that humans can become better. And what we are organizing in our, we would have to call it, our set of knowledge, is to become better humans and make humans work better." (From Dr. Po Chung's autobiographical writing).

"We will form groups where middle-level supervisors or bottom-level workers, but not managers, suggest some tactics for improving. And we will organize some sharing sessions after improvement...During the process, all can learn how to be mutually inclusive, help each other, give feedback to each other, and coach each

other...Through the process, each team can learn something within the team and also form other teams. Besides, all members involved can obtain much recognition..." (Colleague A's sharing in the interview).

"We have many line trainers. But how can we identify line trainers from employees? First of all, he or she should be enthusiastic about the work so that he or she can serve as a role model. Then, we will train his or her training skills. Generally speaking, after one employee is certified as a line trainer, he or she will conduct training workshops with all managers as trainees. In fact, we did not expect the benefits associated with the 'line trainer' concept at the very beginning. However, this practice has brought about substantial positive outcomes regarding people development...It fosters the development of communications skills, facilitation skills, and presentation skills among those line trainers. The managers also realize that their followers have the potentials to become 'stars'." (Colleague A's sharing in the interview).

Based on these narratives, it can be argued that one aspect of humanistic leadership in the workplace is motivating and developing followers. This kind of practice has been shown to be beneficial in previous empirical studies as well. For example, Ojokuku, Odetayo and Sajuyigbe [40] found that leadership focusing on developing followers and satisfying their needs was positively associated with organizational performance. Recently, Zheng, Graham, Epitropaki and Snape [41] reported that service leadership in terms of valuing high-quality service and supporting followers was positively associated with followers' work engagement, which further promoted their service performance. These findings suggest that leaders' humanistic practice can effectively motivate followers and enhance their performance.

THEME 2: LEADERS SHOULD BE PEOPLE-ORIENTED AND HELP FOLLOWERS TO FLOURISH

In the service economy, it is desirable to have self-motivated and proactive employees who are engaged and willing to provide high-quality services. Thus, it is also important for leaders to take care of the needs of their followers in order to motivate them and engage them in collaboratively providing services to others and system. As such, Dr. Po Chung strongly advocated people-oriented leadership in service economy. Particularly, in his writings as well as in the present interviews, Dr. Po Chung highlighted the importance and benefits of satisfying employees' psychological needs in terms of the five pursuits of flourish. He treated such needs satisfaction as having psychic income in addition to material benefits. Some narratives are outlined as follows:

"We realize that we have to lead the staff instead of managing them. We have to let them work happily, feel pleasant when they come back to workplace. We also have to take care of their needs if we want them to feel joyful and work diligently" (Dr. Po Chung's sharing in the interview).

"The DHL leaders showed our people how to get joy and fulfillment through service and how to build their psychic income every day. These tenets became quite easy to practice once our people knew what to do and how to do it. Humility is an organic, intuitive behavior in the people we sought to hire" (Dr. Po Chung's writing in the book) [39].

"DHL discovered that motivating, developing, and enculturating a group of couriers to teach them how to gain positive emotional energy or income every chance they could was one key to our success...DHL leaders modeled the practice of saying thank you, smiling, and putting that psychic income into their emotional wallets...Saving these instances of appreciation allows you to deposit this psychic income into your psychic bank account and build stronger, more self-confident, and healthier self-esteem. It's positive emotion: know how to recognize what it is, how to accumulate it, and how to use the psychic income to your benefit. Service generates positive emotion and generates psychic income. It's good for your body, mind, and soul. We thrive on it, live on it, and that's why we all are born wanting to serve others: it's a psychic reward system" (Dr. Po Chung's writing in the book) [39].

“At DHL, we reduced the transactional costs by paying attention to PERMA –a model of psychological well-being and happiness comprising five core elements...Positive emotion, engagement, relationship, meaning, and achievement. The PERMA formula leads to a happy person and creates groups of happy people – and joyful people in a people-service industry naturally deliver and provide better results” (Dr. Po Chung’s writing in the book) [39].

Notably, empirical studies also supported the beneficial influences of people-oriented leadership (e.g., satisfying the five pursuits related to flourishing) on followers’ well-being. For example, Schultz et al. [42] found that employees in service sectors (e.g., finance, health care, marketing, etc.) were more likely to have higher work engagement and a more positive working attitude if their leaders were able to fulfill their pursuit of meaning and accomplishment. Similarly, Slemp, Kern, Patrick and Ryan [43] revealed that leadership with humanistic features (i.e., a focus on communication instead of controlling, respect for employees’ perspectives, encouragement for self-initiation) was positively associated with satisfaction of employees’ needs in being connected and building a positive relationship with others, which in turn resulted in employees’ higher levels of intrinsic motivation and work engagement. In the Service-Leadership education programmes, there are also findings showing that SL attributes such as caring are related to personal well-being [44, 45]. Thus, empirical findings echo the present narrative findings that effective service leaders should enable followers to have psychic income such as a sense of meaning and relatedness, which can further benefit both employees and the organization in the light of higher internal motivation and work engagement as well as positive work attitude.

THEME 3: A BELIEF OF “EVERYONE CAN BE A LEADER”

For humanity in leadership, empowerment is also an important element. In SLT, it is maintained that “everyone can be, or has potential to be a leader” [46]. Dr. Po Chung and his colleagues in DHL International all believed that empowering leadership could bring positive outcomes to both employees and the organization, such as a sense of ownership and better custom relationships. Related narratives are listed below:

“DHL has bottom-up leadership. What we are doing is delivery of service with people orientation instead of managing production lines...They (couriers) keep making decisions and making improvements. We also let them know that their contributions are key to the success of the company, to the success of customers, and also the success of themselves... Therefore, these are psychic income and joyfulness of carrying the job.” (Dr. Po Chung’s sharing in the interview).

“When management pushed decisions to the lowest level, each courier, acting as the CEO of their own route, could design, create, operate, and upgrade their route to the best of their ability in accordance with the situation in their particular city and get psychic reward as a result.” (Dr. Po Chung’s writing in the book) [39].

“...across the company, everyone understands that decision-making is part of the job. This creates the feeling of ownership, responsibility and contribution among everyone, be they a courier, supervisor, city manager, or anyone else...This signals to each employee that they are trusted and that at any given moment they are empowered to take control and take charge...At the corporate level, this brings joyfulness, engagement, contribution and a deep sense of meaning to everyone, no matter where they are in the company...The result is that our people keep building their sense of achievement, self-esteem, and importance, for themselves and for the global network.” (Dr. Po Chung’s writing in the book) [39].

“... like the “Can Do Spirit,” we always highlight in our unspoken culture, which means that you are determined or self-motivated to accomplish the mission, no matter what difficulties you encounter. I think this “Can Do Spirit” is very pervasive. For example, although you are working in DHL in France, if you receive and respond to a request from your colleague in Hong Kong to help deliver a package, you still have to take the

ownership of the task. You cannot say ‘I don’t know as I am on leave’... Instead, you will pay full attention to the progress and try many methods to accomplish the task.’ (Colleague B’s sharing in the interview).

Traditionally, leadership is seen as a means of exerting influence on a group of followers and making them strive for a common goal [47, 48]. Thus, a leader usually is considered inborn, and only those who are “great men and women” can take a leading role [49]. In contrast, the leading role in service economy is not necessarily occupied by those who are already in a higher position (i.e., top-down leadership). Instead, anyone can contribute to decision-making. Particularly, leadership practices exist in everyone’s daily life, ranging from self-improvement efforts to complex leadership acts such as managing a company. In fact, studies showed that leadership qualities can be nurtured and promoted among the general university student population through well-designed leadership education [44, 50].

In addition, as service economy is characterized by complex human interactions, distributed leadership featured with shared decision-making processes is preferred to enable effective communication between service providers and service receipts [6]. Indeed, empirical studies have demonstrated positive outcomes associated with distributed and empowering leadership. For instance, Ghafoor, Qureshi, Khan and Hijazi [51] found that leaders’ empowerment of employees to take control and make decisions was positively linked with employees’ sense of belonging and self-identity in the organization. The findings implied that empowerment gives employees a sense of ownership and makes them psychologically connected to the organization, which in turn increases their commitment and loyalty. Apart from employees’ belongingness, empowerment can also enhance customer satisfaction and relationship. Ahearne, Mathieu and Rapp [52] conducted a research on salespersons from pharmaceutical sector to examine how leadership empowerment behavior influenced the customer satisfaction and relationship. Results showed that leaders’ empowerment exhibited a significant positive influence on employees’ adaptability, which further resulted in a higher level of customer satisfaction.

To sum up, the belief of “everyone can be a leader” enables leaders to empower their followers in the decision-making process as well as to recognize followers’ strengths and contributions. As a humanistic approach in service leadership, empowerment can enhance the employees’ sense of ownership and eventually increase employees’ determination in achieving better performance and providing better services, which benefit all stakeholders involved, including employees, organizations, and customers.

THEME 4: POSITIVE ORGANIZATIONAL OUTCOMES OF PEOPLE-ORIENTED CULTURE

The last theme emerged from the present interview narratives is the positive organizational outcomes of people-oriented culture in service sectors. Given the transformation from the manufacturing era to the service era, a people-oriented organizational culture has to be fostered in response to the complex environment and challenges in service economy. In Dr. Po Chung’s writings and sharing in the interviews, several organizational positive outcomes were acknowledged as a result of the people-oriented culture in DHL International, such as loyalty and commitment to the company. Dr. Po Chung’s colleagues

also indicated in the interviews that an organization with people-oriented culture can make its employees recognize the value and culture of the organization and automatically adapt to such a culture, even if there was no extra effort made to promote the culture. Related narratives are presented below:

“In the competition, judges were confused. Why did this company get such high scores rated by employees on aspects such as loyalty to the company, cultural recognition, and brand recognition? After all, compared with other organizations which had five or more employee programmes such as ‘Women and Family Friendly’ and others, this company only had one programme of ‘Employee of the Year Award’. After I knew the company is DHL, I realize that it is all about those unspoken things and what I can feel instead of those different programmes. In fact, we do not have that kind of programmes. In the best of time in our days, we actually do many fundamental training and projects, and pass the things down to others.” (Colleague A’s sharing in the interview).

“DHL began to formulate clear and reliable guidelines...Pushing decisions to the lowest level...Establish company values that are an extension of family values...These practices generate employee loyalty which, in turn, results in low turnover, institutional memory, and institutional partner relationships. Maintaining a continual sea of familiar, friendly, smiling faces enabled DHL to facilitate ease in inspiring the people to find daily positive energy from making contributions to the company. (Dr. Po Chung’s writing in the book) [39].

In addition to the present qualitative findings, previous empirical research also revealed that a people-oriented organizational culture leads to positive organizational outcomes. For example, Liu, Zhang and Xiong [53] investigated how organizational culture impacted employees’ commitment to the organization. They found that a people-oriented organizational culture and climate (e.g., openness to the employees) exerted a significant positive influence on employees’ affective and normative commitment to their organizations. Similarly, Suharti and Suliyanto [54] identified a positive association between the people-oriented organizational culture and employees’ loyalty. Their study highlighted that a people-oriented organizational culture characterized by the supportive attitude to employees, open climate, and the focus on satisfying employees’ needs was able to cultivate more engaged employees who showed high loyalty and strong intention to stay in the organization.

A possible explanation of the above observation is that a supportive and people-oriented organizational culture is arguably conducive to employees to achieve human needs satisfaction in the organizational context, which in turn promotes employees’ commitment to the organization. Under a positive and people-oriented organizational culture, employees are more engaged, feel proud to work and psychologically safe, which could maintain their loyalty to the organizations. To conclude, both the present findings related to the fourth theme and previous empirical evidence suggest the benefits of building a people-oriented organizational culture in service economy.

DISCUSSION

Using a qualitative research inquiry, the present study attempted to integrate the humanity notion advocated in the “Service leadership theory” (SLT) with existing psychological theories and empirical findings. The present study has several unique features. First, it links qualitative experience toward humanistic leadership practices in the workplace with theoretical models and empirical research findings. Second, the qualitative data were obtained from key informants, including the person (i.e., Dr. Po Chung) who developed the

SLT and two employees who worked under Dr. Po Chung's leadership for over 25 years in the organization (i.e., DHL International) where SLT has been put into practice since its establishment. Thus, all three informants can provide first-hand information about the humanistic leadership practices and related consequences in a service sector. Third, the qualitative data collected in the present was interpreted with reference to the existing empirical literature, which advances our understanding of the importance and influence of humanistic leadership in service economy.

Three important observations in the present study could be highlighted. First, humanistic leadership includes a wide range of practices, such as taking care of employees' needs, developing their skills, empowering them to take initiations and make decisions, and recognizing their values and contributions. Generally speaking, these humanistic practices can be classified into two major groups: one is the facilitation of employees' development and the other is empowering them to take a leading role under certain situations. These two aspects in fact reflect efforts to fulfill employees' needs at different levels. For example, promotion of employees' development is a means of satisfying needs of competence and self-esteem highlighted in "self-determination theory" (SDT) and "Maslow's hierarchy of needs." Leaders' empowerment to followers to make decisions and take a leading role in certain circumstances help fulfill the needs of autonomy, relationship, sense of belonging, self-actualization, meaning, accomplishment, etc. All these humanistic features reflect a basic principle that "human assets" are fundamental to secure service advantages in a service era [4].

Second, among the above-mentioned elements in humanistic leadership, the belief and practice of "everyone can be a leader" deserves emphasis. This notion reflects a sharp contrast to the traditional perspective that leadership is owned by elites or powerful people at a high position. SLT believes that leadership qualities can be nurtured. The present qualitative findings suggest that such a notion has been put into practice in the business world. Future research should further investigate the universality of the practice in service economy. In addition, such a belief is also applicable in leadership education so that every student can be nurtured to become an effective leader [55]. In fact, several universities in Hong Kong have implemented service leadership curricula or training programmes for university students who wish to develop and improve their leadership qualities [11, 56, 57]. Evaluation findings also showed that such leadership education is effective in promoting students' service leadership attributes as well as well-being [44, 58]. Future efforts should be devoted to expanding humanistic leadership education [59].

The third observation is that humanity in leadership is not only beneficial to the leader and followers, but also leads to better organizational outcomes. The qualitative narratives in the present study revealed that people-orientation in leadership practices in DHL International resulted in employees' strong sense of ownership, loyalty, commitment, and better custom relationships. The experiences shared by Dr. Po Chung and his colleagues are congruent with previous quantitative findings showing positive linkages between humanistic leadership characteristics and positive outcomes at both individual and organizational levels [51, 54]. There is also theoretical discussion on the influences of humanistic leadership on organizational culture and external parties' satisfaction [60]. While most of the previous studies we referred to in the present study were conducted in the Western context, the present qualitative findings obtained in a Chinese community further suggest that the benefits of humanistic leadership could be universal. This speculation calls for further investigation.

The present paper has several limitations. First, an inherent limitation of the present qualitative study is that there might be bias in data interpretation. For example, the interpretations could be influenced by the researcher's own experience and perspectives, thus affecting the reliability of the research findings. To reduce such possibility, several measures were applied in data analysis and interpretation processes to minimize potential bias, including peer as well as member checking for the coding [38]. Nevertheless, further studies could utilize both qualitative and quantitative methods to triangulate the related findings. Second, qualitative data were collected from three key informants. Although they were experienced with reference to service leadership practice, additional interviewees could be involved to yield richer data from different perspectives. For instance, sharing from front-line couriers in DHL International could help us understand the influence of humanistic leadership from the bottom. It is quite possible that empowering not only gives employees chances to make the decision and actualize potentials but also puts challenges and pressures on them. Finally, the present paper mainly focuses on how humanistic leadership has been practiced and the associated influences, future research will benefit from further examining the antecedents of humanistic leadership in both East and West contexts.

Chapter 150

MORAL CHARACTER IN THE SERVICE LEADERSHIP THEORY

***Diya Dou, PhD, Daniel T. L. Shek*, PhD, FHKPS, BBS, SBS, JP
and Zhenli Zhu, MA***

Department of Applied Social Sciences, The Hong Kong Polytechnic University,

ABSTRACT

Human interaction is fundamental in a service economy where service providers provide service to service recipients. As such, whether service is provided in an ethical way is of paramount importance. In the Service Leadership Theory (SLT) proposed by Dr. Po Chung, Co-Founder of DHL International, moral character is regarded as a vital component of successful service leadership. Through the interviews with Dr. Po Chung and his colleagues and an examination of the published work in SLT, we attempted to answer three questions in this paper: a) why is moral character important in the service economy? b) how is moral character conceived in the SLT? c) how is moral character manifested in the organizational culture of DHL International? We also reviewed the concept of moral character in the existing leadership models and research with reference to the SLT. It is concluded that moral character is an important element of successful leadership in the Western and Chinese contexts.

INTRODUCTION

Moral character has been drawing scholarly attention from different researchers because it influences individual, family, and organizational development. As an essential branch of philosophy, moral character has generally been conceptualized as what is good or bad, right or wrong, virtue or vice, and fair or unfair. It relates to values that people attribute to a system of beliefs [1, 2]. Morality, morals, and ethics are often regarded as synonyms sharing similar

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

meanings with slight differences: morality referring to the patterns of thought, action and decision operative in everyday life; moral values (honesty and integrity) attributing to a system of beliefs; and ethics about actions and decisions [2].

The high relevance of ethical concerns in organizations has led to the emergence of a growing body of literature on moral character in leadership and business. According to Giacalone and Thompson [3], moral character plays a critical role in influencing people's way of thinking and decision-making. According to Joyner and Payne [4], good ethics could positively impact the economic performance of companies in the service economy, supporting the idea that "good ethics is good business." In addition, research revealed that a better match between personal and organizational ethics could lead to higher levels of employees' commitment and job satisfaction, and lower levels of turnover intent [5]. According to Bedi, Alpaslan and Green [6], ethical leadership is positively related to followers' perception of leaders' interactional fairness and transformational leadership, as well as followers' ethical behaviors. On the contrary, immoral behaviors in organizations, such as corruption and abusive leadership, will erode consumer confidence and hinder organizational development [7]. Thus, moral character may be invisible in daily operations but crucial for the long-lasting development of an organization.

A Service Era

The world is moving to a service economy. According to the statistics of The World Bank, service sectors have contributed over 60% to the world's total Gross Domestic Product (GDP) since the year of 2000 [8]. The service economy in developed countries occupies a high percentage of the total GDP, such as Israel (69.8%), Japan (69.1%), and Canada (66.7%) in 2018 [8]. Famous for its finance, trade, law, and other services, Hong Kong is undoubtedly a service economy. The service sectors in Hong Kong accounted for 92.2% to the total GDP in 2008, and for 93.1% in 2017 [9]. More than 87% of the total working population in Hong Kong are employed in the service sectors [9]. Besides, many developing countries have witnessed a big rise in the size of the service economy in recent years. For example, China has made great efforts to transform from a manufacturing economy to a service economy. A considerable amount of work and resources have been devoted to service sectors, such as scientific services, high-technology services, and other higher-end services [10]. The size of service sectors in China has doubled in the last two decades to account for 52.2% of the total GDP in 2018 [11]. In line with the trend, the service economy emphasizes quality humanistic service and sets new requirements for leadership qualities, which calls for a new leadership theory to better understand the key to effective service organizations.

The Service Leadership Theory

Dr. Po Chung, the Co-Founder of DHL International and Chairman of Hong Kong Institute of Service Leadership & Management (HKI-SLAM), has proposed the Service Leadership Theory (SLT) in the context of a service economy [12]. Unlike traditional leadership concepts, the SLT fits the needs of the service economy by reflecting a service

mind through principles such as “to serve to lead” and “for the benefits of others”, instead of a sole focus on the interests of the leaders or goal completion [13]. According to the SLT, service leaders should “do the right things” rather than only “do the things right.” The SLT aims to answer the question: What type of leaders or leadership does the service economy need? According to the SLT, effective service leaders should possess Competence, Character, and Care (the 3Cs). In other words, service leaders are those who have proper soft skills and abilities, personal growth, and moral standards, but not necessarily the ones associating with certain positions [14]. Numerous studies have evinced that the SLT is a useful framework in guiding personnel development programs to promote soft skills and well-being [15].

In an interview, Dr. Chung expressed his ideas on leadership and leaders referring to his career at DHL International that trust, the 3Cs (especially character) and the mindset of serving clients at a humanistic level are the qualities that service leaders should possess [16]. In his leadership, DHL International is a company that practices service leadership, aiming at promoting people’s lives through providing green logistics [17]. Shouldering the social responsibilities, DHL International displays a good company moral character in the processes of meeting the needs of its clients and the natural environment. Therefore, by taking DHL International as an example, this paper attempted to explore the moral practices in a service-oriented company in the service economy era.

Based on the above literature review, three research questions were framed in the present study:

1. Why is moral character essential in the service economy?
2. How is moral character conceived in the SLT?
3. How is moral character manifested in the organizational culture of DHL International?

OUR STUDY

A qualitative approach was used in the present study to understand moral character as well as DHL International’s moral practices in the framework of the SLT. Compared to quantitative research, which often focuses on “searching for truth”, qualitative research aims to “bring meaning to a situation” [18]. In the present study, the data were collected through Dr. Chung’s autobiographical writings, individual interviews with Dr. Chung, and group interviews with Dr. Chung’s colleagues. One of the main advantages of autobiographical writings is that this method allows the author to recall memories and give sense and meanings. It also allows the researchers to have a higher level of interpretation through the author’s reflection. Interviews give the interviewee(s) opportunities to express views verbally, allow the interviewer(s) to improvise follow-up questions based on the responses, and foster reciprocity between the interviewer(s) and interviewee(s) [19]. In addition, group interviews provide information about ideas and perceptions that a group of individuals have on certain issues. Group interviews illuminate the similarities and differences between the perspectives of a group of individuals [18] which can serve as a strategy for triangulation.

Data Collection

The data were collected between October 2019 and May 2020, which included Dr. Chung’s autographical writing texts, five individual interviews with Dr. Chung, and two group interviews with two of Dr. Chung’s former DHL International colleagues.

Dr. Chung was firstly invited to write about his experiences related to the origin and development of the SLT. The autobiographical writings provided contextual information for researchers to make an initial inquiry for interviews. Based on Dr. Chung’s writing texts, his publications on the SLT and its application in DHL International, and a review of the existing academic literature, the initial interview questions were developed. Three researchers reviewed the questions and provided feedback and comments regarding the relevance and appropriateness of the questions. The questions were then revisited and refined accordingly, resulting in a semi-structured interview protocol. Interviews with Dr. Chung aimed to understand moral character as a desired leadership quality within the framework of the SLT. Interviews with Dr. Chung’s two former colleagues focused on their perceptions of the organizational environment and the practices promoting moral character in DHL International. The interview questions with Dr. Chung and his colleagues are listed in table 1 and table 2, respectively.

Table 1. Interview questions with Dr. Chung

1	What is the role of moral character in effective service leadership?
2	What types of character do you believe are crucial in establishing effective leadership in DHL International? Can you give us some examples of those most important ones?
3	Do you think adopting traditional Confucian values in leadership practice can help promote moral character? Can you give us some examples based on your experiences?
4	How does DHL International build a healthy culture or habitat to recruit, retain, and promote employers with characters? Could you share some examples with us?
5	Do you think it is difficult to keep a balance between moral character, well-being, and profit in a context where profit is still highly valued by the market? Why?

Table 2. Interview questions with Dr. Chung’s two former colleagues

1	Service Leadership Model upholds the 3Cs (Competence, Character and Care). What are your views on this model?
2	One of the Cs is character. What are your views on the Service Leadership Theory?
3	What character attributes do you believe are crucial in establishing effective leadership in DHL International? How does DHL International incorporate these character attributes in leadership practices? Could you give us some examples?
4	In your opinion, what are the challenges/difficulties of applying Service Leadership Theory (e.g., 3Cs)? Any examples in DHL International? And what strategies did DHL International use to deal with these challenges/difficulties?
5	Do you practice the Service Leadership Model? Any personal reflections?

The interviews were conducted by two researchers who were familiar with the SLT and made Dr. Chung’s acquaintance prior to the interview. Based on Dr. Chung’s recommendations, two of his former DHL International colleagues, Mr. A and Ms. T, were invited to participate in the group interviews. Both of them were senior staff with more than 25 years of working experience at DHL International. In total, five interviews were conducted with Dr. Chung, and two group interviews were conducted with Mr. A and Ms. T. Before

each interview, the researchers obtained permission from the interviewee(s) to record the interview.

Data Analysis

All interviews were transcribed verbatim. Thematic analysis was used in the data analysis to develop a coding scheme [20]. In the process of data analysis, the research objectives were explicitly communicated to three researchers. Firstly, a researcher reviewed the transcripts to gain a general and holistic sense of the data and independently selected the contents relevant to research questions and preliminarily identified themes. Secondly, the researcher revisited the scripts and revised the codes and themes to improve the alignment between themes and research questions. New themes were added as they emerged. Thirdly, the codes and themes were peer-checked by another researcher. The two researchers had several rounds of discussion to determine the level of connectedness and improve coding reliability. Fourthly, the revised codes and themes were again peer-checked by a third researcher who was experienced in qualitative research and had good knowledge of the SLT to maintain the credibility of the data analyses [21]. Adjustments were further made in coding and themes based on the feedback. All the autobiographical writings and interview transcripts were analyzed with RQDA (an R package for qualitative analysis) [22].

OUR FINDINGS

Dr. Chung underscored the indispensability of moral character in the SLT from different perspectives, including the requirements of the service economy, the positive outcomes that moral character drives, and the negative outcomes brought by a lack of moral character.

The Requirement of a Service Economy

In Dr. Chung's book entitled "The 12 Dimensions of a Service Leader", moral character has been argued as the most critical element of one's personal brand. Dr. Chung suggested that the shift from a manufacturing economy to a service economy has made people, instead of machines, the key to successful business development, which calls for a new set of leadership qualities that are different from what has been desired in a manufacturing economy:

"One of the aims of Service Leadership training is to highlight the crucial role that a leader's character for success in a service organization. Service isn't necessarily customer service, by the way, but across a network of people who are united by a vision and positive energy. Therefore, a person's character is of the kind that is free from the toxic behaviors and qualities that erode trust across those in the group" (Dr. Chung's autobiographical writing)

More specifically, in a manufacturing economy, leaders who have strong managerial skills are considered effective in improving collective productivity and efficiency. Meanwhile, moral character does not often gain particular emphasis in the manufacturing economy, and

sometimes can be even downplayed when potential conflicts between ethical standards and economic efficiency may occur. In contrast, the service economy highly demands for people skills to attract, maintain, and develop followers, to build and promote trustful relationships in the internal and external environments of organizations. Dr. Chung explicitly differentiated leading from managing in the two types of economies:

“Management is all about operational efficiency, stability, and excellence – in short, doing things ‘right’ or well. In our view, leadership is more about doing the right things with the right heart. This is about ensuring that what a company does is aligned with human values and needs, resulting in the greatest good for communities and stakeholders” (Dr. Chung’s autobiographical writing)

In Dr. Chung’s opinion, the economic transformation from a manufacturing economy to a service economy reshapes the relationship between leaders and subordinates. Leaders are those who attract and keep followers, but not necessarily the ones occupying managerial positions:

“It is the position that defines the relationship between managers and subordinates. However, for leaders, the relationship is defined by followers. You need to be followed by someone before you can be called a leader” (Dr. Chung’s autobiographical writing)

“It’s a human-relationship thing instead of an employment thing. The follower follows you because he finds things that he can get from you. So what is in it for me to follow you? You are not paying me to follow you. It is volunteering, a will to follow you. So it’s a human relation instead of an employment relation” (The first interview with Dr. Chung)

In this regard, if leaders have flaws in their character, they are not able to maintain followers in the long run or build a healthy organizational climate:

“The most important thing in a follower following you is after they ask the question to themselves - not necessarily asking you - that ‘what’s in it for me? What benefit will I get if I follow you?’ So usually there are three things to consider: I can learn things from you, I find there are qualities that I can trust and respect you, and at least you don’t have the qualities that push me away. So these are the pulling forces” (The first interview with Dr. Chung)

One important belief of the SLT is that service leaders need to provide quality service to everyone that one interacts with, including oneself, others, groups, communities, systems, and environments [23]. In Dr. Chung’s opinion, leaders in the service economy should provide quality service to followers, such as effective mentoring, to promote followers’ competence and character building. In this regard, leaders’ moral character is essentially required by the service economy to attract and keep followers:

“The Service Leadership model I designed, on the other hand, is most interested in helping a leader improve their character through careful self-knowledge, self-governance and commitment to continuous learning and development. To put it another way, that a leader’s greatest self-actualization comes by helping everyone in his or her network meet all their needs, including each person’s individual self-actualization” (Dr. Chung’s autobiographical writing).

The Positive Outcomes of Moral Character

As discussed earlier, existing research has linked leaders' moral character to various outcomes at both the individual and organizational levels, such as leaders' and followers' job satisfaction, organizational commitment, cohesion, collaboration, and work performance [24, 25]. Promoting ethical codes will also improve the leader-follower relationship within a company [26]. Dr. Chung also joined the agreement that solid ethical codes of a company promote its competitiveness, particularly through building trust in both internal and external relationships. In Chung's opinion, leaders with good moral characters can attract the best people and motivate them to give full play to their potential in work. Dr. Chung particularly challenged the mindset that "if you want to make more profits, you have to give up care, or give up character." He holds the belief that if a leader pays a lot of attention to character and care, and learns the competences of leading and motivating followers, the leader can get both:

"It's not an 'either/or' question. Yes, if you keep your eyes only on money, which is profit, you think that you don't have to pay attention to the other things. In a manufacturing economy, it can be true because when facing a production line, you'll improve the management and knows how to manage the robots. But people hold that belief forget that humans are not robots. If you can lead them better with a heart while doing the right thing, people would work faster, work better. On the production line, everybody controls other people's speed. But on the service line, it's not. It's whether you put your heart into, and your smile, and take what you learn from being a leader and take it home, and treat your spouse better, your children better, your in-laws better, your cousins better. The whole tribe benefit...it is not only the balance but what you do as a priority. If you put character as a priority, what you would do is make good people stay with you longer, so that you don't have a turnover" (The first interview with Dr. Chung)

As to the external relationship with customers and the public, Dr. Chung argued that treating customers with good character behaviors such as respect, courtesy and fairness will result in a trustful relationship between customers and companies. When customers are well-treated, they tend to establish a long-term business relationship [27]. Moreover, ethics can be a powerful marketing advantage for a company because the service relationship depends on these hidden qualities that are often unspoken and unwritten [27].

Negative Outcomes When There is a Lack of Moral Character

Dr. Chung applies the Anna Karenina principle to demonstrate the negative outcomes due to a lack of character. Adapted from the opening sentence of Leo Tolstoy's novel *Anna Karenina* that "all happy families are alike; each unhappy family is unhappy in its own way," the Anna Karenina principle states that a deficiency in any factor required for success dooms an endeavor to failure. In other words, a successful endeavor should be free of any possible deficiencies. Dr. Chung applies this principle in understanding the importance of moral character:

"A lack of character can get you in all kinds of troubles, and there are thousands of ways of having bad character... Followers will follow leaders as long as they can learn things from leaders. However, if there are values in leaders' behavior that push followers away, the followers will leave after learned what they wanted to learn" (The first interview with Dr. Chung)

Dr. Chung discussed different negative consequences caused by a lack of good moral character. A lack of good character immediately impairs interpersonal relationships and threatens the company culture. Even if the unethical person has not cheated others, the knowledge that one may act unethically toward others stops people from maintaining the relationship and encourages them to establish collaboration with morally sound people:

“There are leaders who think that as long as I have all the competence, it would be okay. But, if you have all the competence, but no character and no care, you cannot keep people’s loyalty and their heart and their stay. They will look for somebody that has the same competence but also has the character and the care. This is how it operates in an open environment; in a closed environment, there’s nowhere you can go, then people just live under fear and control” (The fifth interview with Dr. Chung)

Dr. Chung’s colleagues shared the same view that a leader’s character is essential in attracting committed followers. One colleague pointed out that:

“Leaders are all the time being observed by others around them. People will evaluate your competence - which is very basic - and people will also evaluate leaders as a person. Leaders need to be fair and just. Otherwise, no one will follow them” (The first interview with Dr. Chung’s colleagues)

In Dr. Chung’s opinion, in a service economy where people are the key to successful service, a high turnover rate essentially means a significant threat to a company’s competitiveness:

“When the best ones left, you could not keep the best team. So, if you want to maintain competitiveness, recruit the best people, maintain the best people, and keep them for a long time” (The third interview with Dr. Chung)

“If your best people keep on leaving because you have no character, your competitor will get your people. So you may be started as the best company, but every eight months, one of your best people joins your competitor, then two years later, you won’t be the best company in providing a service” (The first interview with Dr. Chung)

When the flaws in character further develop and leaders turn a blind eye toward immoral practices, a lack of moral character can cause a serious public relations crisis. There have been cases involving companies that abuse customer profiles. These moral crises also cost companies much to enforce internal ethics codes and to restore public trust. Although no companies will include respect, courtesy, fairness and the trust results from these qualities in any contract, lacking these qualities can “prove empty and sterile to both the customer and to the service provider” [27]. Dr. Chung argued that leaders lacking essential moral character can cause dysfunction of the team and even the entire organization:

“If you have somebody lacking character but taking managerial positions, the team will not work. A lack of character will make it go wrong. For example, if people at the middle level involve a “MeToo” issue, your entire organization will not work” (The third interview with Dr. Chung)

Dr. Chung’s colleagues raised an interesting point concerned with the changing dynamics of the company culture, which reflect the reciprocal influence between workplace values and personal values. A leader with moral characters will attract followers sharing the same values, which in turn strengthens the moral climate of a company. In contrast, a leader lacking moral qualities or tolerating other’s immoral behaviors will expel followers, which will consequently undermine the ethical foundation of a company:

“Although we all know the saying that ‘don’t think any vice trivial, and so practice it; don’t think any virtue trivial, and so neglect it,’ sometimes people feel that ‘it doesn’t matter and nobody knows what we did.’ Then this value will be slowly instilled and integrated as one’s own belief. This belief will affect our behavior and even change our life trajectory. If a company prioritizes performance and considers money everything, it is not a service-mind company, but a business-target-driven company. In fact, in such a company, human nature will be distorted” (The second interview with Dr. Chung’s colleagues)

“People who are evaluated by others as “not satisfactory” normally don’t last very long, as they don’t feel comfortable staying here and they had a hard time. Once I had a superior who was competent but often gave comments that made me felt being despised. That person could not fit in our culture and both he and the people around him felt stressed. He left DHL after half a year. In such a short time period, he quitted due to a mismatch with the culture in DHL” (The second interview with Dr. Chung’s colleagues)

This idea actually reflects the notion of person-organization fit, which means the compatibility between individuals and organizations [28]. Person-organization fit can be based on goals and values. Research indicated that organizational ethical values were positively linked to organizational commitment and person-organization fit. In addition, literature also supports that the exchange between individuals and organizations, and the expectations about reciprocity can influence individuals’ adjustment to the organizational culture [28, 29]. It is suggested that companies should adopt ethical policies that increase individual perceptions of an ethical company environment [30].

The Conceptualization of Moral Character in the SLT

As mentioned above, moral character is listed as one of the core 3Cs in the SLT. Different from most leadership models that primarily highlight the existence of specific virtues and conducts when conceptualizing moral character, Dr. Chung adopts the “opposite” perspective emphasizing the avoidance of a lack of any critical virtues. According to Dr. Chung, each tradition has a variant of the Golden Rule, which advises doing unto others as one would have done unto oneself. The reverse can be called the Silver Rule, which is an inversion of the Golden Rule, advising people to avoid the behaviors that one would not want to be done unto oneself. More specifically, the Golden Rule highlights the proactive gold standards instructing one’s behaviors. In other words, it tells people how to behave altruistically. The Silver Rule, in contrast, is not against the existence of self-interest, but against asocial self-interest or egoism [31]. It tells people to “first do no harm.” The Silver Rule provides demanding standards for one’s behaviors and requires people to view behaviors from others’ perspectives [32].

Dr. Chung found it challenging to communicate about the Golden Rule to students because people understand morality differently and adopt diverse personal codes of ethics. However, identifying immoral behaviors is far less controversial than defining moral behaviors [33]. Dr. Chung believed that it could be an easy and straightforward way to define moral character by using “double negative” notions:

“If our humanity is looking for a leader, we need to find out if they have a deficit in these places. It is a very succinct and simple way to explain what character means. Character means that you don’t do immoral things” (The third interview with Dr. Chung)

Table 3. Thirteen Confucian virtues and the adapted “negative” virtues

Confucian virtues (The Golden Rule)	Adapted Confucian “negative” virtues (The Silver Rule)
Kindness	Don’t be unkind.
Righteousness	Don’t be unfair.
Respect	Don’t be rude.
Wisdom	Don’t be foolish.
Trustworthiness	Don’t be untrustworthy.
Loyalty	Don’t be disloyal.
Courage	Don’t be cowardly.
Uncorrupted	Don’t be corruptible.
Shame	Don’t be shameless.
Care for the old	Don’t abuse the old.
Care for the young	Don’t abuse the young.
Self-correction	Don’t refuse to correct when you are wrong.
Forgiveness	Don’t hold a grudge.

In Asian societies where Confucianism dominates social life and values, there are sayings reflecting the Silver Rule. Table 3 outlines the opposite notions of 13 Confucius values [33].

In Dr. Chung’s opinion, people who take leadership roles need to go a step further than only adopting the Silver Rule as personal codes of ethics. To keep the best followers sharing the same values, leaders also need to protect the whole team by showing zero tolerance towards others’ immoral behaviors in the workplace:

“When you are the leader, not steal, not cheat, and not lie are not enough because when you are the leader, these rules are a little bit short. You have to say, ‘I would not cheat, I would not lie, I would not steal, and I would not tolerate those people who do.’ Then people around you, your friends, your relatives, and people who follow you or your peers will feel that you are looking after each other” (The first interview with Dr. Chung)

Dr. Chung’s incorporation of Confucian values into leadership practices has been supported by the literature. Ip [34] reviewed the application of the core elements of Confucianism in modern business and proposed a notion of “Confucian firm” with idiosyncratic concepts of the moral person (Junzi), benign social structure (He), relationships (guanxi), and core human morality (ren, yi, li). It was concluded that Confucian values, such as familial collectivism, have implications for business in Chinese societies. According to Spitzer [35], the Silver Rule can be restated in a functional language as “avoid harming others.” Leadership adopting the Silver Rule provides the first and fundamental rule of ethics for people to live out.

The Emphasis of Moral Character in the Organization Culture of DHL International

Moral character has been highly valued in DHL International culture. According to Dr. Chung, although family education and early experiences play critical roles in forming one’s personal codes of ethics, the source of one’s moral standards involves both nature and nurture [27]. Many practices in DHL International have been designed and implemented to identify and promote vital moral qualities valued by the company.

Practices Identifying One's Character in the Personnel Decision-Making Process

According to Dr. Chung, one's personal ethics and a set of character attributes will be brought to the job. In DHL International, the selection mantra, "Hire for character, train for skills," has been adopted in the hiring process [27]. Dr. Chung stresses the importance of well-designed hiring processes and well-trained interviewers to reveal character traits and tendencies of the candidates [27]. In addition, character is a critical item to consider when making a promotion decision. In DHL International's practices, the character of a candidate for a leadership position is evaluated by the people around him/her. The senior staff also serve as gatekeepers:

"If you would like to know one's moral character, you ask other people. For example, when promoting somebody, we talk to people around this person and ask, 'we are promoting one of the supervisors to be the assistant manager. Other than yourself, who do you think should be that person? Don't pick the most popular one just because that one can tell jokes. But remember, you have to work for this person after he got promoted.' Then people will find somebody who is fair, who thinks correctly, and who understands the vision of the company" (The first interview with Dr. Chung's colleagues)

Besides, when a person has flaws in competence, moral character and care, the person will be assessed and subject to dismissal. Besides, the person having flaws in character will not be promoted:

"After three or four times being passed over for promotion, they will tend to leave the company. They either blame the company for not promoting them or they realize that something about them is the reason not being promoted after our coaching" (The fourth interview with Dr. Chung)

Practices Promoting Moral Knowledge and Climate

In DHL International, moral knowledge and practices are promoted through company codes of ethics and through on-the-job mentoring. Personnel development programs are designed to equip staff with a service mindset, people skills, and other abilities and knowledge to better align personal values to workplace values. According to Dr. Chung's colleagues, many of the DHL International personnel developmental programs gave sufficient attention to character-building:

"It is not possible to teach all couriers all contingent solutions to all situations. The only possible way is to teach them how to be a good person. If they go back home and behave the same, it means that they are touched" (The first interview with Dr. Chung's colleagues)

In practice, the development programs refreshed participants' mindsets about service and helped them become more competent in leading themselves and others. One colleague highly acknowledged the benefits of these development programs:

"When I look back, I realize that our training program is helpful to build character rather than solely teaching skills — although we also teach skills, such as customer service skills, telephone skills and complaint handling skills, the foundation is character building. We all know that one should lead by modeling and should take the initiative to make things better. The training helped me to reflect on myself instead of criticizing,

condemning, or complaining. With good character, you will treat colleagues and costumers nicely. It even benefits my family life, as I am now happy to be the one taking proactive steps and initiating change” (The first interview with Dr. Chung’s colleagues)

In addition to in-house training programs that communicate company ethics codes, DHL International also employs on-the-job mentoring to cultivate core values. In other words, leaders in DHL International are encouraged to lead by example. As a colleague of Dr. Chung mentioned:

“You cannot finish setting rules, but instead, you can lead by example and let people know what is acceptable and what is not” (The second interview with Dr. Chung’s colleagues)

In this regard, Dr. Chung emphasized the importance of self-leadership and the awareness of one’s responsibility to others. In particular, senior staff taking the leading positions need to consistently reflect on and improve themselves:

“In the beginning, I’m just a courier; then I become a supervisor; then I become a manager. So every time I go up, I realize that I have to do certain things in this position: when I am a courier, I have to take care of document collection and show a warm smile to my customers; when I deal with the airline and the customers, I have to build the relationship and do business; when I supervise followers, I have to behave. In every step and during times when something comes up, I behave appropriately, and I learn. I’m still learning now, today. It could be I’m still learning here because I have done all there” (The first interview with Dr. Chung)

DISCUSSION AND CONCLUSION

In the study, we addressed the rationale of including moral character as one of the core 3Cs in the SLT, reviewed the conceptualization of moral character rooted in the traditional Chinese values, and explored the manifestation of moral character in the organizational culture of DHL International.

Based on Dr. Chung’s autobiographical writings and the interviews with Dr. Chung and his former DHL International colleagues, we found moral character indispensable for leaders who want to attract the best followers and maintain organizational competitiveness in a service economy. The conceptualization of moral character in the SLT has incorporated traditional Chinese values and philosophies. This integration is in line with the call for interpreting organizational ethical codes and practices in the contexts of social values and culture in recent research [36]. Besides, the application of the Silver Rule can be a straightforward and practical way to communicate the basics of moral character [35].

Our findings also evince the positive impacts that moral leaders and culture can bring, including an increase in the congruence of person-organization fit, followers’ character-building, and organizational commitment. These positive impacts also echo the existing research, which has consistently revealed the positive influence of moral character on both individual and organizational development [25, 37].

Besides, this study discussed ways to promote moral character by exploring the practices in DHL International. Firstly, moral character can be cultivated through well-designed personnel development programs. We suggest that the personnel development programs should pay sufficient attention to cultivating the inner qualities of the staff rather than narrowly focusing on improving their skills. In other words, both the “Being” and the “Doing”

aspects of human qualities should be incorporated in the development programs. Besides on-the-job training, the preparation for university students to appreciate the importance of Service Leadership qualities is also important [15]. Secondly, the cultivation of character will trigger positive changes in employees' ethical mindset and behaviors in the workplace and even in personal life [38, 39]. Also, the interaction between individual and organizational values results in changing dynamics of organizational ethics, which yields important insights for promoting the ethical culture of organizations in the long run.

While this study highlights the importance of moral character based on the analyses of the published work of Dr. Po Chung and interviews with him and his colleagues, this study has some limitations. First, our analyses were based on Dr. Chung's autobiographical writings and interviews with Dr. Chung and two senior colleagues. It would be more interesting to invite some junior staff to share their perceptions of the manifestation of moral character in DHL International. Second, other data sources, such as field observations and text analysis of company documentation, can be informative to evaluate the applications to promote moral character in DHL International. Third, quantitative data could be collected from employees of DHL International to triangulate the qualitative findings of the present study.

Despite the limitations, this study provides insights into the moral character literature by exploring moral character in the framework of the SLT. We also reviewed the concept of moral character in the existing leadership models and research concerning SLT. We can draw the conclusion that moral character is considered critical leadership quality in different leadership models in both Western and Chinese contexts.

Chapter 151

THE DARK SIDE OF LEADERSHIP IN THE SERVICE LEADERSHIP THEORY

Diya Dou, PhD and Daniel T.L. Shek*, PhD, FHKPS, BBS, SBS, JP

Department of Applied Social Sciences,
The Hong Kong Polytechnic University, Hong Kong, PR China

ABSTRACT

The dark side of leadership is not uncommon in the business world. It is often driven by a pursuit of short-term personal interests at the cost of others and organizations. Existing literature has revealed its negative influences on individual and organizational outcomes, such as employee motivation, interpersonal relationship, and organizational effectiveness. In the service economy, the dark side of leadership may bring even greater destructive outcomes to individuals and organizations as it undermines the quality of service and people relationships that are highly valued in the service economy. As such, to prevent the dark side of leadership is of paramount importance. According to the service leadership theory (SLT) proposed by Dr. Po Chung, Co-Founder of DHL International, the dark side of leadership occurs when leaders lack Competence, Character, or Care. Through interviews with Dr. Po Chung and his former colleagues in DHL, as well as an exploration on Dr. Po Chung's autobiographical writings, we tried to understand the dark side of leadership in the service economy under the framework of the SLT, and the practices adopted by DHL International to prevent it. Results indicate that the conceptualization and destructive impacts of the dark side of leadership in the SLT echo existing academic research. In addition, results also highlight practices and strategies adopted by DHL International to prevent the dark side of leadership.

INTRODUCTION

The dark side of leadership in business contexts is not uncommon. We watch news media demonstrating how “dark” leaders tarnish a company’s reputation, damage its market value and even make people suffer. The dark side of leadership has gained scholarly attention in recent decades and has become one popular research topic in the field of management [1]. Different terms are used in the literature to depict the characteristics of the dark side of leadership, such as undermining, destructive, unethical, negative, tyrannical, abusive, toxic, and derailed leadership [1, 2].

Existing research has provided different definitions of the dark side of leadership. McIntosh and Rima [3] defined it as the inner urges, compulsions, and dysfunctions of leaders’ personalities. Bass and Steidlmeier [4] indicated that the dark side of leadership occurs when leaders serve with bad faith. Similarly, Aasland et al. [5] argued that the concept of the dark side of leadership is broad and involves different behaviors. In their overarching definition, destructive leaders refer to those who repeatedly violate the interest, goals, and resources of organizations, and obstruct motivation, job satisfaction, and effectiveness of followers [6]. According to Eisenbeiß and Brodbeck [7], unethical leadership refers to leaders’ behaviors that violate the moral standards and promote unethical conducts in organizations [8]. Schilling summarized the characteristics of negative leadership, which include insincerity, despot, exploitation, restriction, failure, laissez-faire, and passive leadership [9]. Furthermore, Aryee et al. [10] and Whitman et al. [11] suggested that the dark side of leadership is reflected in uncaring and humiliating behaviors towards subordinates. For example, leaders using abusive supervision tend to yell at subordinates, which increases their stress level and threatens their security and career development. Besides, supervisors’ undermining behavior means unfavorable treatment of the followers aiming to prevent them from achieving individuals’ goals [12]. According to Duffy et al. [13], supervisors’ undermining behaviors include repressing followers when they raise questions, belittling their ideas, talking down to them, subverting their efforts, and making them feel incompetent. Also, derailed leadership displays uncaring or unethical behaviors towards followers, such as bullying or harassment [6]. McCall and Lombardo [14] indicated that derailed leaders have poor management skills and are insensitive to followers when demonstrating intimidating and humiliating style.

Apart from different definitions and conceptualizations of the dark side of leadership, scholars have also explored its negative influences on individuals and organizations. For individuals, the negative impacts can be work-related or life-related [2]. In the workplace, Tepper and his colleagues [15] pointed out that abusive supervision in leadership would increase followers’ resistance to the leaders and lower the level of job satisfaction [16, 17]. In addition, Aryee and his colleagues [10] pointed out that followers who perceived their leaders as destructive were less likely to dedicate to their job. Similarly, Liu and his colleagues [18] found that abusive supervision in leadership led to a cascade of followers’ creativity as it undermined followers’ intrinsic motivation. For the life-related aspect, empirical findings have suggested a close relationship between abusive supervision and more significant work-family conflicts based on employee’s perceptions. For example, Tepper [18] reported that the followers who experienced higher levels of abusive supervision reported a more significant negative spillover from their work to their family life, as they perceived oppression and

injustice in their work. Hoobler and Brass [19] argued that an abusive leader could extend the subversion to the subordinates' family members, such as their parents and spouse.

The dark side of leadership also harms organizational relationship, climate, and effectiveness [2]. Li and Zhu [20] found that destructive leadership provokes followers' negative emotions and undermines organizational cohesion, interpersonal harmony, and task collaboration among employees [16, 21-23]. Tepper [16] found that subordinates who worked under abusive supervision perceived greater work conflicts and worse relationships with their leaders. Mitchell and Ambrose [24] reported that followers might show "displaced deviance" towards the organization, which was related to retaliation, resistance, and negative behaviors. Ashforth [25] indicated that tyrannical leadership would create work alienation, make followers treat the organization negatively, and increase their turnover intention. Besides, Zhang and Liao [26] also found that abusive supervision brought negative effects to organizational performance through counterproductive interactions and exchanges between subordinates and leaders [27, 28]. Therefore, subordinates were more likely to respond to abusive supervision by being resisting and slack at work. Hence, the dark side of leadership not only erodes personal development but also negatively affects organizational climate and effectiveness.

According to the Service Leader Theory (SLT) proposed by Dr. Po Chung, the Co-Founder of DHL International, Competence, Character, and Care (3Cs) are the three fundamental and indispensable characteristics for an effective service leader [29]. When there is a lack of any of the 3Cs, the dark side of the leadership occurs. Without competence, the leaders are unable to attract and retain high-quality followers in a competitive circumstance. Without a competent leader, the whole team or the organization will lose a clear direction for the long-term development and hardly maintain its competitiveness in an open marketplace [30]. Besides competence, care and character are also vital elements of successful leadership that are strongly emphasized in the SLT. According to Chung [30], people may follow those leaders who are competent but uncaring only for a short period. When followers acquired what they have been longing for, such as leaders' competences or resources, they will leave and follow another leader who has competence, character, and care. A lack of care will shake followers' confidence in leaders and lower their willingness to stay. The deficits in character of leaders threaten interpersonal relationships in organizations, undermine the trust among people, and increase employees' turnover rates. Moreover, leaders without good character will lead the whole organization in the wrong direction by endorsing immoral behaviors, bullying subordinates, and chasing for personal interests at the cost of followers, companies, customers, and even the society. According to the SLT, a lack of any of the 3Cs can cause leadership failure and severe damage to persons and organizations, especially when the destructive leader takes a high position in an organization [2]. This article aims to explore the dark side of leadership under the framework of the SLT based on interviews and autobiographical writings. Three research questions were framed:

1. Why do we need to prevent the dark side of leadership in the service economy?
2. What is the dark side of leadership according to the SLT?
3. How does DHL International prevent the dark side of leadership in practices?

OUR STUDY

As demonstrated above, these constructed research questions seek to enhance our understanding of the dark side of leadership in theory and practice by exploring the perspectives, life stories, and experiences of others. With this epistemological underpinning, a qualitative approach was used as it provides great depth and details when inquiring into human interactions and life events [31]. The qualitative research approach focuses on idiosyncratic meanings created, extended, and expanded by people, and thus highlights openness and invites multiple realities in data collection [31]. Among the methods that embrace a qualitative nature, narrative inquiry is a powerful tool to probe into the complexities of individual life stories through storytelling and personal narratives, and it requires collaboration between the narrator and the narrative researcher to construct the meaning [32]. It aligns well with our research purpose of making in-depth meaning of people's stories and experiences, and therefore it is suitable for the present study. To be specific, the study draws on the methods of autobiographical writing, individual interviews, and group interviews to collect narrative stories from the informants.

The narrative data were collected from October 2019 to May 2020. We first invited Dr. Po Chung as the key informant. He was first asked to complete a piece of autobiographical writing on general topics in the SLT, such as the origin of the SLT and his views on existing leadership models. Based on his autobiographical writing, we conducted five semi-structured interviews with him to follow up on several focused areas including the dark side of leadership. Two of his former colleagues who had worked in DHL International for more than 25 years were also invited for two group interviews. These interviews revolved around their career experiences in DHL and the connection to the SLT, especially how the SLT was applied in daily practice. Informed consent was obtained from the three informants before the data collection.

A well-trained research assistant performed data transcription. The data that were conducted and responded in Cantonese were translated into English. Thematic analysis was employed to generate patterns and themes from the data. First, the chunks of data related to the dark side of leadership were pinned down by three researchers. Second, one researcher identified patterns that occurred, and combined them to themes. Two peers then reviewed the themes and corresponding narrative chunks for the credibility of the data analysis. The initial researcher would revise them based on the feedback. Finally, the refined themes were sent to informants for participant validation.

OUR FINDINGS

RQ1: Why Do We Prevent the Dark Side of Leadership in the Service Economy?

Unlike standardized products in an industrial economy, services in the service economy bear the features of intangibility and heterogeneity, leading to a higher degree of variability, customization, and uncertainty of service products [33, 34]. Furthermore, the production and consumption of service products are simultaneously and inseparable, and thus the quality of

services largely and crucially depends on the competencies of service providers [33]. These dynamic features in the new era set a higher bar for employees, making it essential for them to be innovative, autonomous, professional, adaptable, and intrinsically motivated [33, 35]. The service economy also requires leaders to embrace qualities such as empathy, caring, sincerity, flexibility, and trustworthiness [36]. The two former DHL colleagues, based on their career experiences in service sectors, shared their perspectives on the consequences that the dark side of leadership could incur for organizations as well as for individuals.

Destructive Interpersonal Skills of a Leader Repel Colleagues and Undermine Organizational Effectiveness

According to the interviewees' accounts, interpersonal competence of a service leader played a critical role in team collaboration and employee satisfaction in the workplace. Failing to foster a good relationship with subordinates often led to miscommunication and low employee recognition, which adversely affected organizational productivity and effectiveness. The recount of their experiences corresponds to the perspective that "hard skills" (professional knowledge and skills) do not suffice for career success in the service economy [37, 38]. Equipment of both strong hard and soft skills, including the interpersonal skills, enables one to navigate the complexity in a career and maintain an efficient workflow:

"We fired some of our employees not because of their incompetence in the professional field, but because they were stepping on others. This behavior amounts to incompetence because it is important to collaborate with others, across the teams or within the teams. If a person is capable of completing the tasks, but always steps on others and unable to effectively handover a task to or takeover a task from others, it means he or she is incompetent... If a person upsets colleagues every time he or she engages in a task, and makes a lot of troubles which would, in turn, delay things, it means this person is incompetent... Fulfilling a task includes competencies in communication and relationship-building, which are as important as the tasks themselves... You have to have good interpersonal skills—not to say you have to make friends, but at least you have to maintain that relationships." (The second interview with the colleagues)

"In fact, he was a person with ability, a good man, but he couldn't communicate in our DHL environment. He carried out things in the way he believed to be right and ended up with not getting along with the peer group and the employees." (The second interview with the colleagues)

Self-Centered Leadership Erodes Team Morale and Sabotages Supportive Working Environment

One distinguishing feature of the SLT is that its systems orientation which includes "self, follower, habitat, and larger system," and it is the service leader's responsibility to maintain a healthy habitat for the team [36, 39]. It is premised on that self is only one orientation in the systems, and service leaders should not focus on excessive self-interest. Instead, they need to inspire and empower the team to grow and pay due attention to shared decision-making [36]. This premise makes the SLT markedly different from heroic leadership, such as charismatic leadership, where only the leaders are always under the spotlight [40]. In the interviews, the former DHL colleagues cast doubts on the effectiveness of self-centered, heroic leadership to navigate the complexity in a service industry based on their experiences. Explicit in their accounts is that this type of leadership would erode team morale and give rise to a hostile working environment:

"It is more obvious for service leadership, because you can't lead people like this. You will never be a true leader, because you are the only hero in the team. On a certain level, being a hero is okay if you want to lead a team or have a winning team, but you can't be the single hero all the time... A service often requires joint efforts,

so as a leader you need to break through the barrier. Don't be too self-centered. You need to be considerate of other colleagues." (The second interview with the colleagues)

"(The problem with this type of leader is) he can't duplicate the task because he is the only one who can manage it. Maybe he has no idea of how to teach others, or he's reluctant to do so because if he teaches others, he will become less worthy, so he will hide those skills..." (The second interview with the colleagues)

"I realized culture could influence interpersonal relationship. We wouldn't be so supportive, because it was not necessary. I could just mind my own business. I wouldn't remind others of their mistakes because it was none of my business." (The second interview with the colleagues)

The Dark Side of Leadership Restricts Personal Career Development

As discussed earlier, existing literature focuses on the negative outcomes brought about by the dark side of leadership for subordinates such as discontent, anxiety and depression [16, 18]. In the same vein, narratives of the DHL colleagues showed that the dark side also brought about negative outcomes for leaders themselves. The dark side, such as excessive self-interest or the lack of crucial soft skills, would lead to an obnoxious and unhealthy environment, which in turn undermined the team performance and restricted personal development of the leaders:

"For some colleagues, being a supervisor or a team leader will be the end of the road for them. It will cause problems if they continue, not because they lack seniority, loyalty, or competence, but because they don't have the coaching or communication skills, or the leadership skills to carry a team." (The second interview with the colleagues)

"It gave me a deep impression that one guy, a very talented and experienced guy who worked in the DHL for a short time. He was self-defeated. To be around him was painstaking. The colleagues would not judge him directly, but you can tell people did not want a lot of interactions with him. He was difficult to communicate with. He also found it pains-taking to work here, so he left." (The second interview with the colleagues)

"Some people are skillful, but they may think it takes much effort to teach others, so they could just do it all by themselves. On these occasions, the company often promotes them to a middle-level leadership position because they are capable, but then they will create problems because he is the only one who is capable in the team." (The second interview with the colleagues)

RQ 2: What is the Dark Side of Leadership According to the SLT?

It is a Narrow Road to Eschew Dark Leadership Constructs

To reveal how the dark side of leadership is conceived in the SLT, Dr. Po Chung and Bell in their publications [39] and our interviews reiterated a well-known quote from Anna Karenina Principle, namely, "Happy families are all alike; every unhappy family is unhappy in its own way." It shows an essential notion in the SLT — it is a narrow road to become an effective service leader and to eschew the dark leadership constructs. As demonstrated in the Introduction and Dr. Po Chung's studies elsewhere [2, 39] that the absence of any of the 3Cs, such as incompetence, ill moral standards and lack of caring disposition, would have detrimental impacts on organizational performance and preclude successful leadership. Dr. Po Chung articulated this perspective again in his autobiographical writing:

"There are many examples of leaders who did very well or got far ahead with only one strong C. Crucially, there are many examples of bad or toxic leaders who managed to get many people down the wrong path of history or at least the path towards great human advancement and achievement but with corrupt, if not outright evil or toxic ends." (The autobiographical writing of Dr. Po Chung)

Many Dark Leadership Constructs are the Antithesis of Confucian Virtues

The SLT is deeply influenced by Confucian ideology and ethics [30]. Chung listed 13 doctrinal ideas from Confucianism that were crucial for service leadership ethics — “Kindness (‘ren’, 仁), righteousness (‘yi’, 义), propriety (‘li’, 礼), wisdom (‘zhi’, 智), trustworthiness (‘xin’, 信), loyalty (‘zhong’, 忠), courageousness (‘yong’, 勇), incorruptibility (‘lian’, 廉), having a sense of shame (‘chi’, 耻), filial piety (‘xiao’, 孝), brotherly love (‘ti’, 悌), self-correction (‘gai’, 改), and forgiveness (‘shu’, 恕)” [2]. Accordingly, the virus or the dark side of leadership is the antithesis of these virtues. In one of the interviews, he shared a broader spectrum of viral values or behaviors reflected in Chinese traditional philosophies on which leaders should keep alert:

“掛羊頭賣狗肉 (‘gua yang tou mai gou rou,’ sail under false colors), 睜眼說瞎話 (‘zheng yan shuo xia hua,’ lie through one’s teeth), 指鹿為馬 (‘zhu lu wei ma,’ deliberately misrepresenting something), 生安白造 (‘sheng an bai zao,’ deliberately provocative), 過河拆橋 (‘guo he chai qiao,’ ungrateful and leave one’s benefactor in the lurch), 大石砸死蟹 (‘da shi za si xie,’ surrender to power), 秋後算賬 (‘qiu hou suan zhang,’ people bide time to take revenge), 借刀殺人 (‘jie dao sha ren,’ make use of another person to get rid of an adversary), 死不認錯 (‘si bu ren cuo,’ stubborn to admit mistakes), 面子大過天 (‘mian zi da guo tian,’ false sense of pride), 打完齋不要和尚 (‘da wan zhai bu yao he shang,’ ungrateful and leave one’s benefactor in the lurch), 講一套做一套 (‘shuo yi tao zuo yi tao,’ one’s words are not matched by deeds), 惡人先告狀 (‘e ren xian gao zhuang,’ The guilty party files the suit first), 借屍還魂 (‘jie shi huan hun,’ something revives in a new guise), 反口覆舌 (‘fan kou fu she,’ break one’s promise), 瞞天過海 (‘man tian guo hai,’ being deceptive), 趁火打劫 (‘chen huo da jie,’ loot a burning house), 殺人放火 (‘sha ren fang huo,’ being vicious), 無中生有 (‘wu zhong sheng you,’ deliberately provocative), 笑裏藏刀 (‘xiao li cang dao,’ nice-nasty), 釜底抽薪 (‘fu di chou xin,’ sabotage other’s efforts), 渾水摸魚 (‘hun shui mo yu,’ take advantage of a crisis), 關門打狗 (‘guan men da gou,’ control and then destroy someone), 遠交近攻 (‘yuan jiao jin gong,’ manipulate powers), 偷天換日 (‘tou tian huan ri,’ cheat), 指桑罵槐 (‘zhi sang ma huai,’ make groundless accusations), 假癡不癲 (‘jia chi bu dian,’ being deceptive), 反客為主 (‘fan ke wei zhu,’ a guest supplanting the host), 美人計 (‘mei ren ji,’ badger game), 反間計 (‘fan jian ji,’ sow discord), 苦肉計 (‘ku rou ji,’ play weak or innocent), 金錢計 (‘jin qian ji,’ corruptive).” (The fifth interview with Dr. Po Chung)

RQ 3: How Does DHL Prevent the Dark Side of Leadership in Practices?

As demonstrated in the data and research [2], any absence of the 3Cs can lead to mismanagement and counterproductive performance, contaminating a supportive working environment and burning out enthusiasm and job satisfaction of the employees. It can be seen from the excerpted examples below that in order to prevent toxic leadership, the DHL International had been committed to different systems that encouraged continuous self-improvement in competence, moral standard, and caring disposition to establish a virtuous circle:

“... All department heads or above would have no other option [of whether to organize programs/workshops or not] but be nominated as trainer automatically. You would be trained as a trainer first, and as a trainer or facilitator, you need to lead your colleagues from your department and other departments too... We also had other regular courses (for the trainers) such as the management course, where the trainers would sign up, being trained by the training consultants and evaluated of their strengths... DHL built a culture like this. You would be assimilated by this environment, even you were not the type of manager or executive before.” (The second interview with colleagues)

“... Many leaders won’t teach you. They would say, “You could just follow me.” It was like this before, but fortunately we changed because DHL used ISO system, which required supervisors to prepare a process document for subordinates and ask them if the document made sense to them. If yes, the subordinates could go on with their works, otherwise it meant that there were some problems with the process document, and it needed revision. This solved the challenges that some of the supervisors lacked team spirit and were reluctant to share his unique skills.” (The second interview with the colleagues)

“In DHL we had Employee of the Year, as many companies did. Normally the selection criteria gave the most attention to business performance. In many companies, Employee of the Year meant best business performance. However, in DHL, business performance was only one of the measurement criteria, and the criteria were not absolute... If we focus on creativity for employees from a department dealing with creative business, it meant the colleagues in the IT Department could never be selected for this honor, because they couldn’t create any new business. But what could they create? They could create a good technical service environment... So in DHL, you could see colleagues in different departments engaging in different jobs all had the opportunity to be nominated as Employee of the Year, including many jobs we easily took for granted such as the cleaning lady.” (The second interview with the colleagues)

DISCUSSION

This paper aims to understand the dark side of leadership in the era of service economy by reviewing the autobiographical writings of Dr. Po Chung and interviewing him and his two former colleagues in DHL International. Results summarize the conceptualization of the dark side of leadership in the SLT, its negative impacts, and ways to prevent in organizations. In general, the outcomes extracted from Dr. Po Chung’s autobiographical writings and the sharing from the Dr. Po Chung’s and his two colleagues’ interviews echoed the existing literature, which highlighted the indispensability of the 3Cs and destructive influences of the dark side of leadership on individuals and organizations [2, 16, 18, 20].

Three observations are highlighted in the study. Firstly, the dark side of leadership involves a lack of any of the 3Cs. According to the SLT, competence, character, and care are the fundamental features of an effective service leader. To maintain competitiveness in the service economy, leaders need to be not only competent but also supportive, empathetic, sincere, and trustworthy [36]. In particular, the importance of care and character of leaders and the destructive outcomes of a lack of care or character were clearly illustrated by Dr. Po Chung and his colleagues. For leaders who lack a caring disposition, the followers tend to have a lower level of attachment with their leaders, which also increases their willingness to leave [2]. Shek, Chung, and Dou [2] suggested that a lack of character may destroy trustful relationships between followers and leaders, and thus increase the turnover rate. In short, a lack of any of the 3Cs covered in the SLT results in the dark side of leadership.

Secondly, the dark side of leadership can bring destructive influences on leaders, followers, and organizations in the service economy, which is consistent with the literature. For example, Li and Zhu [20] proposed that a destructive leadership model can bring negative emotions to followers and influence their mental health, and thus affect the cohesion of the organization. Besides, literature also suggests that the dark side of leadership can hinder one’s development [2], which is reflected in Dr. Po Chung and his colleagues’ sharing. Liu, Liao, and Loi [18] claimed that abusive leadership erodes followers’ creativity and undermines followers’ intrinsic motivation in career development.

Thirdly, some approaches have been suggested to prevent the dark side of leadership. It is important for leaders to be aware of the negative impact of destructive behaviors and committed to creating organizational mechanisms to prevent destructive behaviors. Besides,

well-designed human resource management systems and policies are needed to encourage continuous self-improvement in competence, character, and care. These systems will promote a positive organizational culture, which can prevent the working practice of “command and control” in organizations and the dark side of leadership. Besides, time and collective efforts are also needed to promote positive changes in leadership and organizational culture. Lastly, the dark side of leadership reflects the antithesis of Confucian virtues. Companies do not work in a vacuum, and organizational culture is greatly influenced by its interaction with social environments and values. Results also indicate that the dark side of leadership is undesirable in both Western and Eastern values.

Although this paper clarifies the nature of the dark side of leadership and ways to prevent it, this paper has several limitations. First, this study only involved qualitative data, as the source of information mainly came from the three interviewees. Quantitative data can be collected to have a holistic and accurate picture. Secondly, social desirability bias can exist as the respondents may tend to fulfill the favor of society when answering questions, especially for those questions regarding the dark side of leadership. Considering the potential bias, we need to interpret the results with caution.

Despite the limitations, the present paper contributes to the ongoing discussion on the dark side of leadership by examining the nature, and the negative outcomes of the dark side of leadership through the lens of the SLT and ways to prevent it based on the practices of DHL International.

Chapter 152

CARING LEADERSHIP IN SERVICE ECONOMY

***Xiaoqin Zhu, PhD, Daniel T. L. Shek*, PhD, FHKPS, BBS, SBS, JP
and Zhenli Zhu, MA***

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

Care is one of the three key elements of effective leadership in the service era, according to the service leadership theory. Existing literature has highlighted the contribution of caring behaviors to personal growth, interpersonal relationships, and leadership effectiveness. The present chapter analyzed the qualitative data based on Dr. Po Chung's autobiographical writings and interviews with him and his two colleagues in DHL International. This study also integrated findings with the existing literature regarding the influence of leaders' caring behaviors. The present narrative findings suggest that caring leadership can be put into practice in terms of allowing followers to make and learn from non-moral mistakes as well as the "*Master and apprentice*" approach. Consistent with the previous evidence, the present findings suggest that caring leadership benefits the leader, followers, and the whole organization.

INTRODUCTION

Since the emergence of the service economy in the post-industrial era, the world has been emphasizing knowledge, service, and human capital [1]. In this context, the concept of caring leadership highlighting leaders' caring disposition has drawn much attention. The word "caring" is derived from the Latin word "cura" (i.e., "cure of the soul"), which is a multi-faceted concept that includes managing, devotion and healing, etc. [2]. In modern times, caring indicates having others in one's considerations, other-oriented, a state of helping other people grow with support and encouragement [3]. Caring also means always answering a call

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

for help, being there for the “other”, and immediately responding to others’ needs [4]. These recent conceptualizations of caring echo Kahn’s [5] earlier identification of eight dimensions in caregiving, namely “accessibility”, “inquiry”, “attention”, “validation”, “empathy”, “support”, “compassion”, and “consistency”.

While other-orientation and taking care of others’ needs can be regarded as the key elements of caring, there are also other unique features of conceptualization of caring in specific professions. For example, within the teaching context, besides orientation towards others, caring disposition is also seen as commitment, relatedness, physical care, expressing, affection, parenting, and mothering [6]. In nursing, caring disposition is closely related to clinical leadership and is seen as an integral part of the nursing profession [4]. Furthermore, the common components of caring have been identified, including empathy, communication, devotion, healing, and attention with empathy [3, 7, 8]. According to Houghton et al [3], caring is displayed by involving and engaging others, including deep listening, entering into another’s world and being entirely accessible or emotionally engaged. For example, Louis, Murphy, and Smylie [9] highlighted that “caring is often defined by its broad purposes: promoting the general development, welfare, and well-being of others; addressing particular needs of others; and developing the capacity for caring among self and others” [9]. Stephens and Carmeli [10] remarked that organizational caring refers to “a set of values and principles that focus on fulfilling employee needs” while felt care refers to “the experience of feeling that one’s co-workers consider, support, and show concern for one’s needs” [10]. All these theoretical emphases on caring are in line with Maslow’s hierarchy of needs, where the needs of love represent a higher level of human needs [11].

Caring is beneficial for personal growth, leading to high morality, self-regulation, self-significance, and self-esteem [3, 12, 13]. Morality, as Wren [14] argued, is linked to caring dispositions such as kindness and fidelity. Therefore, developing caring dispositions in children is an important part in developing morality and self-regulation [13]. Hunzicker et al [12] found that teachers working in a school environment with a higher level of support and mutually caring relationships were more likely to enhance their self-esteem and self-efficacy.

Caring can also benefit interpersonal relationships [15]. For example, Hargreaves [16] found that teachers’ caring disposition influenced their relationships with students, parents, and colleagues. The teacher preparation program at Larmer University emphasized trust and caring relationship between master teachers and student teachers because a good interpersonal relationship contributes to teachers’ positive transformation and professional development [15].

Caring is also of paramount importance for leadership effectiveness. For example, in educational institutions, leadership strategies that fail to embrace caring orientation undermine teachers’ practices and self-efficacy, hence leading to powerlessness and incompetence in leadership [16]. In the healthcare system, leadership with a caring disposition does not only benefit nursing practices, but also contributes to organizational effectiveness and professional satisfaction of the employees [17]. Spears [18] argued that servant leadership was strongly based on leaders’ caring behaviors, which may also improve mutual caring among group members. In line with this notion, caring disposition was found to be helpful in achieving servant leadership goals such as personal growth, shared decision-making and teamwork building [17]. A caring servant leader can listen attentively to the messages sent by employees, show genuine empathy to them, have the ability to heal relationships and commit to employees’ personal growth [17]. Likewise, Houghton et al. [3]

asserted that shared leadership served as a primary driver for the development of group-level caring, which was in turn conducive to better group performance and team spirit.

In addition, caring disposition is among the three key components of effective service leadership. Service leadership is a concept that emerges along with the rapid development of service economy [19]. Different from traditional leadership theories which emphasize more on leaders' "hard skills" and "doing" (e.g., giving commands and managing people), service leadership theory (SLT) focuses more on "soft skills" and "being" (e.g., whole-person development) with the purpose of nurturing a younger generation of leaders to satisfy the diversified needs of oneself, others, groups, communities, and the whole society [20]. SLT proposes that three "Cs", namely, "competence," "character," and "care", are key to effective leadership practice in the service economy [19]. According to SLT, on top of professional and leadership competencies, a good service leader should be caring in serving others with good character qualities. The relationship between caring disposition and service leadership has been specifically stated and analyzed from different perspectives. Shek and Li [21] stated that caring disposition is the first priority for a service leader as it contributes to the growth of followers, organizational effectiveness, the leader's maintenance of authority, power, and career success. Shek and Li [21] also emphasized the importance of nurturing university students into caring leaders as care represents a core value of effective leadership in the contemporary service era.

In order to fulfill the demands of effective service leaders in Hong Kong, where service economy contributes more than 90% to total GDP [22], the SLT has also been adopted to guide different leadership programs in local universities to nurture tomorrow's service leaders. These programs have been evaluated and proven to be effective in promoting students' well-being, leadership qualities and values related to service leadership [23, 24]. While the importance of nurturing caring service leaders has been emphasized and the STL has been shown to be an effective framework in youth leadership training, how caring leadership is conceived and practiced in service sectors that endorse service leadership remains under-researched. Practically speaking, it is also necessary to outline the benefits of caring leadership in an organization to further promote SLT in the service economy. As such, the present study endeavored to address these two research questions by integrating existing empirical evidence with interviews on leadership practice in DHL International, where service leadership refers to the practices aiming at promoting employers' well-being and customers' lives through providing high-quality services [25]. While the importance of nurturing caring service leaders has been emphasized and the STL has been shown to be an effective framework in youth leadership training, how caring leadership is conceived and practiced in service sectors that endorse service leadership remains under-researched. Practically speaking, it is also necessary to outline the benefits of caring leadership in an organization to further promote SLT in the service economy. As such, the present study endeavored to address these two research questions by integrating existing empirical evidence with interviews on leadership practice in DHL International, where service leadership refers to the practices aiming at promoting employers' well-being and customers' lives through providing high-quality services [25].

OUR STUDY

In order to have a deeper and more thorough understanding of data provided by interviewees, a qualitative methodology was adopted in the present study. Compared to quantitative approaches, qualitative approaches are more beneficial in revealing rich information and in-depth meanings behind words and numbers, such as personal experiences, emotions, attitudes, etc., with a subjective perspective through an interviewee's words and an objective perspective through observations and analyses [26]. Being widely used in social sciences, qualitative approaches include many research methods with different foci, among which narrative inquiry emphasizes interviewees' life stories and experiences [27]. With narrative inquiry, researchers can gain a deep understanding of the interviewee's thoughts and feelings, and how he or she sees the world based on the data collected via autobiographical writings, journal writings, interviews, and observations that provide rich data and information. Thus, the present study employed narrative inquiry by collecting data from D. Po Chung's autobiographical writings, individual interviews with him, and group interviews with his two former colleagues in DHL International.

Data Collection

By adopting a qualitative methodology, the authors interviewed Dr. Po Chung, the Co-Founder of DHL International, and two of his former colleagues in DHL International, A and B, in order to have a clearer picture of how the caring disposition and SLT are applied and practiced in the company and the outcomes of such practice. As the key informant, Dr. Po Chung was interviewed five times from October 2019 to May 2020. During the same time period, Dr. Po Chung's colleagues, A and B, previous senior managers with over 25 years of working experience in DHL International, were invited to share their interpretations of SLT and views toward the practice of caring leadership in the workplace in two group interviews. The interviews were semi-structured with open-ended questions for flexible and in-depth responses on theoretically driven topics. Before the interviews started, well-informed consent was obtained from Dr. Po Chung and his colleagues for the interviews being audio-taped and further analyzed.

Data Analysis

All the interviews were conducted by two well-trained researchers, and some of the scripts were translated from Cantonese into English by the research team as interviewees shared some views in Cantonese. The interview transcriptions were checked and confirmed by the interviewees. Thematic analysis was used to identify and interpret the patterns and themes emerging from the data collected in this study. Data analysis in this study was performed by three experienced and qualified researchers. After the interview transcriptions were confirmed, the data were reviewed and categorized into condensed summaries concerning the topic of "caring disposition" by an experienced researcher. The researcher then further identified the themes from the condensed summaries and grouped similar

conceptual themes into a broad thematic concept. After this step, the other two researchers reviewed and checked condensed summaries, themes, and the broad thematic concepts for peer checking on the credibility of the data analysis. Based on the peer checking comments, the first researcher refined the theme structure. Member checking of the finalized codes was then conducted by involving the informants.

FINDINGS

Theme 1: Caring is to Allow Followers to Make Mistakes and Learn From Mistakes, and Caring Leadership is Practiced through the Master-Apprentice Approach

In the industrial age where the leadership was highly autocratic and had minimal communication with followers, only satisfying the needs of manufacturers was the major concern in leadership practice [1]. In contrast, the leaders in the service economy emphasize the importance of care as one of the elements in the three 3Cs principles in SLT, which means showing sincerity and empathy in providing services and caring for others' needs [1]. According to Dr. Po Chung's and his colleagues' viewpoints, there are two important aspects of caring leadership in the service economy. First, leaders need to allow employees to make mistakes and let employees learn from their own and other colleagues' mistakes so that they will not make the same mistakes in the future. Another aspect of being a caring leader is to serve as a role model who treats employees as human assets rather than "machines". This is called the "Master and Apprentice" approach in DHL International, through which employees can learn from leaders in an open and inclusive environment. As Dr. Po Chung and his colleagues shared:

"We allow colleagues to make mistakes. It is impossible that every task can be done by the most experienced person. Therefore, it is unavoidable to have some newcomers do the tasks without related training and experience. Then he will make mistakes. How should we treat such mistakes? Do we need to lay him off? Of course, we can lay him off if there is no other solution. However, can we take this mistake as a good lesson to learn from and share the experience with others so that other people will not make the same mistake? The situation is simply like falling into a hole. You have to fill the hole after you come out so that others will not fall into the same hole. Here we have an example. A boy drove a van to deliver customers' files. He forgot to close the window of the van when delivering files. Finally, an entire bag full of cheques was stolen. After that incident, his supervisor did not dismiss him. Instead, his supervisor told me that the young boy would be one of the best couriers. It is because he will not make the same mistake in future. Besides, he will share this experience with other colleagues if we keep him and others would not make the same mistake either. I think this approach is incredible. This is one of the first lessons both in life and leadership that I learned from this story." (Colleague A's sharing in the interview)

"The permissive culture of allowing non-moral mistakes was huge because anyone and everyone were allowed to screw up – including the boss – and no one lost face by making mistakes. This was especially important in cultures such as China, Japan, and Korea that heavily emphasized personal responsibility in a way that could bring too much pressure to bear and ultimately be counterproductive. With the "some mistakes are okay" tenet, nobody felt the need to dig in to defend mistakes. The value of this was that the learning from a specific mistake was adopted quickly and shared with the entire network through the channels of communication we had established." (Dr. Po Chung's writing in the book) [28].

"One thing we incorporate is that we teach leaders how to be masters. We use a 'Master and Apprentice' system. And when we finish teaching leaders the master skills, they become masters and train others. They do and transfer their skills to followers. They do, and followers watch. Followers learn from leaders by watching.

So more than just saying, leaders have to behave. Then, followers start doing, and leaders supervise them.” (Dr. Po Chung’s sharing in the interview)

“Apprenticeship is an age-old approach to training. At DHL, we harnessed its wisdom to pass on vital knowledge and skills... DHL used the ‘Master and Apprentice Method’ as the most efficient method for passing on key guidelines and rules in a one-to-one situation. Since DHL could only add couriers on a regular basis but never in large groups, the Master and Apprentice Method has remained the best method for the company when it comes to passing on operational and people-skills training. This method is how DHL built a large team of people with high Competence, Character, and Care... This technique was very much like big brothers taking care of younger brothers, organically teaching them the skills, values, and behaviors as they demonstrated that it took Competence, Character, and Care to run a successful global network company.” (Dr. Po Chung’s writing in the book) [28].

From the above narratives, it can be seen that one method to practice caring leadership is to accept and allow non-moral mistakes made by employees and let them learn from the mistakes. Relating this practice to academic findings, Cheng et al [29] pointed out that leadership with forgiveness, openness, and acceptance had a positive effect on the gratitude of subordinates and repayment to the leaders. Besides, the Master and Apprentice approach, where the master teaches and cares for the apprentice and the apprentice learns from the master at the same time, is considered as an effective strategy of caring leadership to nurture competent, caring, and moral employees in the company. This kind of approach has been found to be beneficial in the empirical research. For example, Wati, Dwiantoro and Juanamasta [30] found that caring leadership mentoring was effective in enhancing nurses’ ability to apply caring leadership and making them feel confident and supportive when they deliver services.

Theme 2: Caring for Others Can Be Beneficial for Oneself

Effective service leadership in service economy is a result of caring disposition, character, and leadership competencies of the leaders. Thus, it is important that leaders are ready to exhibit care and support to the employees. In fact, caring leadership practices bring benefits not only to others and organizations, but also to the one who shows caring to others. One of Dr. Po Chung’s colleagues highlighted how caring for others could be self-beneficial in the interviews. Dr. Po Chung also stressed the benefits to oneself of being caring to others in terms of attracting followers. Related narratives are listed below:

“We always pass the related documents to the girl in the telex room after completing job duties at the airport. She will convert the files into digital format for filing. In general, it is the girl’s job duty to do this work. However, I think she is exhausted. She stays at the office to do the paperwork every day. She is supposed to work from 9 am to 5 pm. Yet, we have to complete delivery tasks at the airport, and we do not know how long it will take as we do not know how many other people are at the airport. In this case, it is uncertain that when we will come back to the office, which may keep the girl waiting for a long time. I told my supervisor and said, ‘we do not need her to wait and do the paperwork. I can type efficiently as well.’ In fact, I did not consider that this is not my job duty. I just proposed a better solution to finish the work without wasting too much time and resources or causing inconvenience to others. Why not, right? Typing is a simple thing for me, and I only spent minimal effort. Probably, my boss noticed my spontaneous ‘kind behavior’ even though I did not know about it. Eventually, I was promoted after this change.” (Colleague B’s sharing in the interview)

“‘What’s in it for me to follow you?’ This fundamental question has Care at its root. Care is again human relations. It is a mixture of empathy, love, and feelings between two human beings... to lead others, you must have charisma that appeals to them. Yet, charisma on its own isn’t enough to help build a thriving global network. Caring for others is an important part of charisma because charisma without care is seen as fake or

forced. Just as a smile without feeling is a fake smile, a person without genuine feeling behind the person's behavior comes across as inauthentic" (Dr. Po Chung's sharing in the interviews and writing in the book) [28].

Particularly, some empirical studies have reported the beneficial influence of caring on oneself. For example, Gentry, Weber and Sadri [31] revealed that leaders who showed more caring and empathy were more likely to be viewed as having better performance in fulfilling their job duties. Caring and understanding followers' feelings, in fact, can be seen as a leader's skill, which contributes to competent management and effective leadership. Similarly, Young et al [32] found that a leader's caring and empathy towards employees was positively related to the leader's opportunity to be promoted. Hence, echoing these empirical findings, the present narrative findings suggest that caring for others can benefit oneself, such as having a higher chance to get promoted in the organization and being admired and regarded as a good leader to follow.

Theme 3: Caring Leadership Increases Employees' Loyalty and Fosters a Better Team

In the service economy, caring leadership is very important as it maintains employees' loyalty, decreases the turnover rate and retains the best team for the organizations. Pellegrini and Scandura [33] stated that leaders who can exhibit care for followers' professional development and personal livelihood would win followers' loyalty and compliance. Dr. Po Chung believed that a leader with care makes employees follow the leader willingly for a long time, and a caring leader can retain the best employees in the team, sustaining competitiveness of the team. Related narratives are presented below:

"And also, when I learn all his competences, and I know his characters are not bad, but if he doesn't care about me, I would rather look for somebody else who has the same competences, the same characters, and cares about me to follow. If he cares about me, I care about him. Then I'll stay with him for a long, long time. If a leader wishes to keep the best followers and maintain good relationships with them, the leader must be caring...So, you want to recruit the best people, maintain the best people, and keep them for a long time. In this way, you can also sustain the competitiveness of your service." (Dr. Po Chung's sharing in the interview)

"While competency is doing things right, character is doing the right things, and care is doing it with the right heart. The person who does things with heart will out-compete the one who does not. Therefore, make sure to treat people right, and usually you'll find that they give 100% or 120% in return. Let's say you have 20 people, and each gives you 25%, then you have a total of five people working for you. Naturally, this can work in reverse. With 20 people giving 120%, then you have 24 people working for you – that is what they call a good return on heart count" (Dr. Po Chung's writing in the book) [28].

Indeed, empirical studies have revealed a positive relationship between employees' loyalty and caring leadership. For example, Wu, Hu and Jiang [34] found that followers' loyalty to a supervisor was positively associated with the supervisor's benevolent leadership. Farr-Wharton, Shacklock and Brunetto [35] reported that nurses were more willing to stay if the supervisor-subordinate relationship has trust, support, care, and respect. Recently, Rupp [36] also showed that caring leadership practice was positively correlated with the intention and willingness to stay among nurses. The finding implied that caring leadership could promote job satisfaction among nurses, and thus increased their intention to stay in their position. To sum up, in conjunction with previous findings, the present qualitative findings suggest that caring leadership with support and trust can retain the best followers with high

loyalty and positive leader-follow relationships, which are fundamental to foster a better team and maintain organizational competitiveness.

Theme 4: Caring Leadership Brings Benefits to Employees and the Organization

The present interview narratives also revealed that caring leadership leads to positive outcomes for the organization. In the interviews, Dr. Po Chung's colleagues shared their views toward positive impacts on employees and the organization as a result of caring leadership practices in DHL International, such as a sense of belonging, commitment to the organization, and high-quality services provided to customers. Below are the related narratives:

"DHL has introduced Service Excellence Programme, putting service into mind. What does 'service excellence' mean? It means that we have to consider serving others in any aspect. We have internal customers in our company. With this concept in mind, the question is how I can help you and make you happy, and vice versa, you also treat me in the same way. Then, you will always think about what you should do, what you should not do, and whether you can take one step forward and do extra things. Simply like what I did for the girl at that time (help the girl in the telex room to document the files). I can help the girl so that she did not have to stay while the company also did not have to pay for her overtime work. Actually, I think that girl did not want to work over-time, not knowing the time to go home every night. In addition, it may cause inconvenience for the girl to get off work late. Therefore, what I did can make the girl happier. At the same time, she would not complain about colleagues from the Operation Department, like saying 'I cannot get off because of you guys.' By considering and caring about others' needs, the relationship among colleagues will be more harmonious and happier. (Colleague B's sharing in the interview)

"Care refers to care for the needs of your followers as they have many needs. You also have to motivate the 'heart' of other people because leading people is leading their 'hearts'. They can do anything for you if you can persuade their 'hearts'. Why are there people who wish to get things done even you do not ask them to do so, or become adaptive? It is because they treat it as their own responsibility, and they have ownership as well. How can we make people have ownership? You have to persuade their "hearts". Like we all have an emotional bank account. For example, sometimes your leader may yell at you. However, in the long run, the colleague may think in this way 'he yelled at me today, but he cares about me in daily work. He allowed me to take leave so that I can travel together with my child. He also helped me with other things.' In fact, everyone has an emotional bank account. If you deposit more into your follower's account in daily life, you can have a better chance to get his forgiveness for yelling at him. I feel that there is a great sense of ownership among colleagues. One really thinks that it is his responsibility to get things done. For example, we are in a team with four people. I will remind you if you do not do well. It is because it is our team's failure, not only your failure, if I do not offer you help. I think we all do not expect to get promoted by beating others down, but to be promoted together. Colleagues always say that 'it is not enough if only you do well or feel good.' Service excellence means only happy employees can provide good services to customers. There is customer satisfaction only if there is employee satisfaction. (Colleague B's sharing in the interview)

"This is the change of mindset, if you pay a lot of attention to character and care and learn all the competence of how to lead people, motivate people, you can have higher productivity. If you can lead people better with a heart while doing the right thing, then they would work faster, work better" (Mr Po Chung's sharing in the interview)

Previous empirical research also showed that caring leadership leads to positive outcomes for employees and organizations as well. Fu and Deshpande [37] investigated the relationship between caring leadership and employees' commitment to the organization. They found that caring leadership exerted a significant positive impact on the employees' organizational commitment. Similarly, Chen et al [38] identified a positive association between leadership with caring and employees' in-role and extra-role performance. A possible explanation for

these findings is that when a leader shows care and concern for employees' personal and job-related well-being, the employees tend to have warm and pleasant feelings and gratitude toward the leader, which could further help establish a reciprocal emotional bond and positive relationships between the leader and the employees. Consequently, caring leadership may help motivate employees to engage in their work by putting in more effort. To conclude, the present findings are consistent with previous research findings, supporting the beneficial influences of caring leaderships on employees and organizations in service economy.

DISCUSSION

With reference to the development of service leadership theory (SLT) and previous empirical studies on caring leadership, this paper explores the practice of caring leadership in DHL International and its significance in the service era by reviewing Dr. Po Chung's autobiographical writings and interviewing Dr. Po Chung and his two former colleagues. Based on interviewees' own first-hand life stories and experiences in the workplace, the present study revealed the two most important elements of caring leadership in DHL International and how leaders, followers, team, and the organization have benefited from caring service leadership. Generally speaking, the findings obtained from Dr. Po Chung's writings and the present individual, as well as group interviews, are in line with the existing literature, which demonstrates that caring disposition plays an important role in service leadership in terms of enhancing personal growth for both leaders and followers, improving team and organization development, and leader-follower relationships [3, 4]. This paper is unique because it does not only explain the importance of caring disposition in service leadership based on theoretical and empirical findings, but also decodes the practical applications of caring leadership and demonstrates the benefits of the theoretical proposal in SLT.

Three observations can be highlighted from the present study. Firstly, caring leadership can be exercised through allowing followers to make non-moral mistakes and learn from the mistakes as outlined in Theme 1. In the workplace, mistakes usually mean loss of profits, so employees are always required to try their best to avoid mistakes, though mistakes are unavoidable. The fear of making mistakes in the workplace might hinder work efficiency, while a culture of learning from mistakes may instead lead to higher productivity. A study conducted by Lorenzet et al [39] showed that trainees receiving guidance about common mistakes and support during error correction displayed a higher level of self-efficacy than error-free trainees. Self-efficacy, in turn, was positively related to the accuracy and working speed (efficiency) of those trainees. Accordingly, instead of demanding no mistakes from followers, a caring leader expects his or her followers to turn a non-moral mistake into a valuable lesson, which would benefit not only the one who has made it but also whoever is witnessing the mistake. In this way, similar mistakes can be avoided, and work efficiency will be promoted while the cost of making mistakes is in fact minimized.

Secondly, in the service economy, when mentioning caring, one may usually think of the benefits that clients or followers receive from being served. However, the leaders who display care to their clients and followers can enjoy benefits from the caring behaviors as well, as suggested by the sharing of one of the interviewees in Theme 2. Harris et al [15] proposed

that caring dispositions can help improve one's interpersonal relationships with others and intrapersonal well-being. Therefore, when applying caring leadership in the workplace, the leader-follower and organization-client relationships will be more successful, from which leaders may also benefit to some extent. In fact, strengthened followers' loyalty to the leader and the best work team retained as a result of the leader's care, as suggested in Theme 3, can also be regarded as bringing about benefits to the leader.

Thirdly, organizations advocating caring leadership can be more competitive in the service economy. McAllister and Bigley [7] concluded that caring organizations that fulfill their employees' best interests and needs make employees demonstrate higher levels of organization-based self-esteem. In the nursing field, a caring disposition is also regarded as an important part of the nursing profession and in the work of nurse middle managers [4]. The present findings also indicate that caring service leadership leads to positive outcomes, such as a lower turnover rate, higher organizational commitment and better leader-follower relationships, all of which will subsequently sustain organizational competitiveness. On the one hand, with strengthened loyalty of followers and their better relationships with colleagues as well as better teamwork brought forth by caring leadership practice, the leaders' leading role and authorities will be better recognized and respected, which establishes a solid foundation for the development of efficient and cooperative teamwork and cultivates a caring organizational culture in the long run. On the other hand, followers can improve their capabilities, efficiency, and self-efficacy by observing and imitating what and how leaders do as apprentices. In addition, followers are not afraid of making mistakes but can improve from making mistakes in a caring organization as they are allowed to learn lessons from their mistakes and avoid making similar mistakes in the future. As a result, operation and leadership processes in an organization are expected to be more smooth and organizational caring cultures will be constantly developing with the growing development of human resources.

Although the present paper instills the concept of caring disposition in SLT and links it to the scientific literature, it has several limitations. First, as the present study only involved three informants, future research should include more people from different levels in different service organizations, such as junior managers or grassroots employees. In this way, a more general picture of caring leadership will be uncovered from multiple angles. Second, this study is a cross-sectional qualitative study. A longitudinal study can be considered as it can help reveal changes in caring leadership and how it may influence leaders, followers, and the whole organization over time. Third, this paper adopted a qualitative methodology based on the analyses of interviews and documents. However, if quantitative materials can be included in the paper, a clearer and more convincing picture can be drawn with greater power in generalization.

Chapter 153

THE ROLE OF TRUST IN THE SERVICE ECONOMY

Wenyu Chai, PhD and Daniel T. L. Shek*, PhD, FHKPS, BBS, JP

Department of Applied Social Sciences,
The Hong Kong Polytechnic University, Hong Kong, PR China

ABSTRACT

Although existing literature has revealed the importance of trust in leadership effectiveness and organizational success, limited research has explored the nature, determinants, and outcomes of trust in the service economy. According to the Service Leadership Theory (SLT) proposed by Dr. Po Chung (co-founder of DHL International), the role of trust in leadership effectiveness becomes increasingly important in the contemporary service economy. Based on Dr. Chung's autobiographic writings, interviews with him and his former colleagues in DHL, and existing literature on trust, this study examined the meanings, determinants, and outcomes of trust in the SLT. Results underscore the importance of trust in the service economy. In addition, results show that service leaders should develop competence, character, and care to build up trust with followers and service recipients.

INTRODUCTION

Trust is the foundation of the leader-follower relationship. Along with the worldwide transformation from a manufacturing economy to a service economy, the importance of trust in leadership effectiveness has been particularly highlighted. In the service economy, human assets are vital as the production and provision of high-quality service rely on knowledge, attitudes, skills, capacities, creativity, and quality of employees [1]. Therefore, building strong relationships with employees, motivating, empowering them, and promoting their competences becomes a leader's central task [1, 2]. As trust is "the building block of social exchange and role relationship" [3], a high level of trust between leaders and followers is

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

essential for relationship building. Although existing literature has highlighted the importance of trust in achieving organizational success, limited research has examined the meaning and role of trust in the service economy. Therefore, this paper attempts to fill the gap by analyzing the literature on trust, autobiographic writings by Dr. Po Chung (co-founder of DHL International and advocator of the Service Leadership Theory in Hong Kong), and in-depth interviews with him and his former colleagues in DHL.

Definition and Nature of Trust in the Leadership Literature

The concept of trust has been defined in various ways in the literature on interpersonal relationships and leadership. Rousseau et al. [4] defined trust as “a psychological state comprising a willingness to accept vulnerability based on positive expectations about the intentions or behavior of another.” In other words, trusting another person means putting oneself in a vulnerable position and taking risks because one believes that the person to be trusted would not harm him or her [5]. Trust was also defined as an individual’s belief and confidence about a set of characteristics of another person, such as competence, morality, and care [3, 6]. Bligh [7] defined trust as “an expectation or belief that one can rely on another person’s actions and words and that the person has good intentions toward oneself.” Based on a literature review, Burke et al. [8] argued that trust was conceived differently in the literature. In some studies, trust was regarded as an inborn personal trait or a propensity, which is hard to be influenced by environments. In some other studies, trust was defined as “cognitive, motivational, or affective states” and “a function of contextual factors” [8].

Scholars also identified two types of trust in leadership literature: cognitive trust and affective trust [9]. Cognitive trust refers to the confidence of an individual’s rational assessment or judgment of key characteristics, such as competence, responsibility, or reliability of a leader [10, 11]. In other words, cognitive trust demonstrates subordinates’ confidence in their leaders’ capacities, qualities, character, and abilities [11]. Affective trust refers to the confidence built on emotional connections between leaders and subordinates and their reciprocal exhibition of care and concern [6, 12].

Nature of Trust in Leadership Styles

Literature suggests that trust is not only an outcome of leadership but also an important underlying mechanism through which different leadership styles exert influence on employees and organizations. First, leadership literature suggests that different leadership styles would lead to different levels of trust. In general, positive leadership styles such as benevolent and moral leadership, transformational leadership, authentic leadership, and servant leadership would promote trust of followers in leaders [3, 13-15]. These leadership styles contain certain common elements, such as showing competence, benevolence, care, and integrity to followers, which would foster followers’ trust-building. On the contrary, some unfavorable leadership styles, such as authoritarian leadership or passive leadership, would lead to a decreased level of trust of employees in their leaders [14, 16].

Besides, leadership literature suggests that trust is an important underlying mechanism on the influence of different leadership styles on subordinate outcomes. For example, trust mediated the positive impact of ethical leadership, authentic leadership, and transformational leadership on individual and organizational outcomes, such as organizational citizenship behavior, work engagement, lower emotional exhaustion, job satisfaction, acceptance of change, and knowledge sharing [17-22]. These studies strongly suggest the important role of trust in performing these leadership styles. As Bligh [7] argued, trust is an important process or foundation in transformational, ethical, authentic, and servant leadership. These leadership styles mainly exert influence on followers through strong relationships, which are based on leaders' trust-related morality, such as integrity, trustworthiness, and credibility. The importance of trust in different leadership styles could also be explained by the leader-member exchange (LMX) theory [23]. High-quality LMX is manifested by the high-quality exchange of information and emotions and high levels of trust, respect, and obligation between leaders and followers [23, 24]. However, there is a lack of theoretical and empirical work based on qualitative data to discuss the concept of trust in the service economy in the SLT.

Determinants of Trust in Leadership

Besides the meaning and nature of trust, existing literature has also identified the important factors determining or shaping trust in leadership or organization. For example, Butler Jr [25] identified ten conditions for the development of trust in a manager, including "availability, competence, consistency, discreetness, fairness, integrity, loyalty, openness, promise fulfillment, and receptivity" [25]. Mishra [26] proposed that subordinates would develop trust in their leaders if their leaders demonstrate competence, openness/honesty, concern, and reliability. However, Butler and Mishra did not provide detailed explanations of each quality. Mayer and Davis [27] also proposed that the three key determinants of trust in an organization are ability, benevolence, and integrity. Ability means strong domain-specific expertise, competence, or skills in completing domain-specific tasks. Benevolence refers to care about the needs and interests of others. A person demonstrating all three qualities would be perceived as "quite trustworthy." However, this model has limitations. First, Mayer and Davis's explanation of each quality is unclear. For example, they regarded benevolence as "concerning others' needs and interests" and "loyalty and honesty," which are more related to moral character. Also, they only highlighted the integrity aspect but did not mention other moral character attributes. Furthermore, this model mainly focuses on the interpersonal and organizational trust-building in general, but not specifically on the trust-building between leaders and followers. Bligh [7] extended Mayer and Davis's model by arguing that competence should include not only domain-specific competence but also generic competence such as interpersonal competence to shape subordinates' trust in leaders.

Impact and Outcomes of Trust in Leadership

A body of literature showed that trust could lead to many positive outcomes at the individual and team levels. First, existing research showed that trust in leaders was positively related to employees' psychological well-being [28]. Besides, high levels of trust led to increased work engagement, job satisfaction, self-efficacy, knowledge sharing, and organizational commitment in workers [3, 12, 29-31]. Research also found that affective trust predicted "in-role" and "out-role" performance of employees [32].

Limitation of the Existing Literature

Several limitations could be identified from the existing leadership literature on trust. First, most studies were based on quantitative research methods, such as questionnaire survey. There have been no research studies conducted by adopting qualitative research methods with particular reference to the service economy. Second, most existing studies were conducted in Western contexts. Given the cultural differences, it is questionable whether the meaning of trust in leadership in Western cultures also applies to Chinese contexts. Third, limited studies explored trust in the SLT, which is an important leadership theory in the contemporary service economy.

Service Leadership Theory Proposed by Dr. Chung

Hong Kong has long been the business and financial center in Asia and a key meeting place for Chinese and Western cultures [33]. Since the end of the twentieth century, Hong Kong's economy has shifted from manufacturing to service orientation. In the 1990s, around 80% of Hong Kong's GDP was contributed by service sectors [34], while this number had risen to around 93% in 2014 [35]. The economic transformation has raised significant challenges to management and leadership in Hong Kong, requiring robust leadership qualities in young people.

As the co-founder of DHL International and the Chairman of the Hong Kong Institute of Service Leadership and Management (HKI-SLAM), Dr. Chung defined service leadership as "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments" [36]. Effective service leadership requires three key leadership qualities: competence, character, and care. First, generic leadership competencies such as task-related competence, leadership competence, and service competence are vital to an effective service leader. These competences enable a leader to have adequate domain-specific knowledge and skills, be able to lead oneself and others appropriately, and have the willingness and attitudes to serve. Effective service leaders should also possess moral characters such as integrity, fairness, and trustworthiness. According to Dr. Chung [36], people with character strengths are considered as friendly and trustworthy. Furthermore, effective service leaders should have care, which means concerns about the mind, body, and spirit of oneself, others, groups, and the whole system. Lack of any of the three qualities would lead to a failure of service

leadership. Compared to other leadership styles (e.g., ethical leadership), service leadership also stresses leaders' morality but upholds higher requirements for effective and successful leaders in the service economy [37, 38].

As trust is vital to successful leadership, the present paper investigates the idea and concept of trust in service leadership based on the interviews with Dr. Chung and his former colleagues, his autobiographic writing, and the scientific literature. The paper was developed based on a research project on the SLT conducted in 2019. As the co-founder of DHL International, Dr. Chung successfully led DHL to become a global service company. During this process, he developed and practiced the concept and theory of service leadership. After retiring from DHL, he has committed himself to the promotion of the SLT in Hong Kong. He has published several books about service leadership, such as *The 12 dimensions of a service leader* [39].

This study adopted in-depth interviews and document analyses. Both interviews and document analyses belong to qualitative research methodology, which is interpretive in nature and focuses on meaning exploration [40, 41]. Qualitative methods could help gain an in-depth understanding of a phenomenon within its real-life contexts [42]. We conducted five in-depth individual interviews with Dr. Chung and two group interviews with his two former colleagues who have over 25 years of working experience in DHL.

OUR STUDY

Interview is an important and commonly used qualitative data collection method. It is valuable in "gaining insights into people's perceptions, understandings, and experiences of a given phenomenon and can contribute to in-depth data collection" [41]. In this study, we used semi-structured interviews. Through open-ended questions, semi-structured interviews allow for unexpected answers, which could lead to a more in-depth discussion on the topics [41]. For the interview with Dr. Chung, the interview questions mainly focused on (a) definition and meaning of trust, (b) key elements of trust, (c) determinants of trust, and (d) the importance of trust to effective leadership. About the interview with his former colleagues, the interview questions mainly focused on how concepts and theories of service leadership (including trust) have been practiced in DHL. All the interviews were conducted from October 2019 to May 2020, which lasted from about 1.5 hours to 2 hours. During each interview, two researchers having rich experience in qualitative research were present as the interviewer and the observer. The process of each interview was audio-recorded and transcribed into full texts by trained research assistants. Besides, Dr. Chung's written materials and published books and articles were also collected.

Analyses of Interview Data and Written Texts

Thematic data analyses were employed to analyze the qualitative data conducted from Dr. Chung's written documents and interviews with him and his former colleagues in DHL. Thematic analysis is a commonly used method in qualitative data analyses, which identifies, analyzes, and reports themes (patterns) within data [43]. This paper adopted a combination of

“deductive” and “inductive” approaches in the process of data analyses [43]. First, a deductive approach was adopted in which the authors of the paper carefully read through all transcripts of interviews with Dr. Chung and his written documents, and categorized the materials based on different themes related to the topic of “trust” in the interview questions. Second, under each broad question, the authors further used an inductive approach to code data into different patterns/themes. Third, the authors merged certain themes to form the final pattern/theme structure. To ensure the reliability and validity, the completed coding was checked by two other researchers and further adjusted based on the peer check feedback.

FINDINGS

Four essential themes emerged based on the interviews with Dr. Chung and his colleagues in DHL as well as Dr. Chung’s written work. These themes are 1) definition and nature of trust; 2) determinants of trust; 3) importance of trust in service economy and 4) consequence of trust.

Theme 1: Definition and Nature of Trust

According to Dr. Chung, trust is a fundamental quality of being a “human being.” Confucius asked rhetorically that “how can one be acceptable without being trustworthy in words (*ren er wu xin, bu zhi qi ke ye*)?” Based on this fundamental idea, Dr. Chung believes that a leader should try his or her best to do things that can build trust with his/her followers. He argued that “the first thing we should do is to avoid doing anything that could destroy trust. And then think of all the things that can help increase trust.”

In general, Dr. Chung defined trust as “a feeling between two individuals,” which contains several levels and different types. At a lower level, trust refers to a feeling that the other person will not harm oneself. At a higher level, trust can be further categorized into morality-based trust and competence-based trust. Morality-based trust refers to the confidence developed based on the moral character of the person. On the other hand, competence-based trust is derived from the confidence in strong competence demonstrated by the person. For example, Dr. Chung said in the interview:

As for trust, I think it is a feeling between two individuals, which can be established at several levels. First, [you trust a person because] he will not hurt you. This is the lowest level of trust. Then there are several kinds of trust. One is the morality-based trust; the other is the competence-based trust. It is very simple to understand them. For example, you trust your brother, right? However, if your brother always does something wrong, you will not trust him in doing things, but you will still trust that he will not hurt you.

By integrating the idea of trust with the SLT, Dr. Chung further argued that trust could actually include three different types: competence-based trust, character-based trust, and care-based trust. For the competence-based trust, it refers to trusting someone because of his/her “reliability” in “doing things” or “accomplishing tasks.” In other words, trusting someone could do things well because the person has a high standard of doing things. The character-based or morality-based trust refers to trusting someone because of his/her high morality or strong character strengths such as honesty and integrity. The third type is the care-based trust,

which refers to trusting someone because of his/her caring for the welfare of others or benevolence. This can be illustrated by Dr. Chung's narratives in the interview:

We can link trust to the three Cs [Competence, Character, and Care]. The first one is the competence-based trust: whether a person is reliable or not [in doing things]; whether a person has a high standard of doing things or not. The second one is morality-based trust or character-based trust: whether a person will cheat others, does he lie, does he steal things? The third one is that you trust a person based on whether he would put his heart in doing things; if you work together with him, whether he cares about you and cares about the work to be done will also influence your judgement of whether he is trustworthy or not.

Furthermore, Dr. Chung proposed that trust is a system. That is, people need to employ a systemic approach to understand trust. The above-mentioned different types of trust are the interrelated elements in the whole system of a person's trust in another person. Therefore, one person's overall trust in another person is not determined by individual elements but by the interactions of different types of trust as a whole. In other words, different types of trust and their inter-relationship/interaction would finally produce a system affecting a person's trust in another person. Dr. Chung has explained this in the interview:

A lot of work is done in a system approach. The system must include different elements. These elements are interconnected, forming the purpose of the system. Trust is the function of the system as a whole. This is system thinking, which is different from linear thinking. Linear thinking is like making a tea ceremony because you need to go from the first step to the next step. System thinking is like viewing a painting. You can view the painting as a whole and also go to some details if you want.

Theme 2: Determinants of Trust

Based on Dr. Chung's definition, the development of trust could be determined by competence, moral character, and care, which are the three elements of effective service leadership. An individual's competence determines whether other people could trust him/her in accomplishing a task professionally. The competence-based trust not only applies to the leader-follower relationship but also relationships between organizations or between the organization and customers. If an organization cannot show competence in its services to customers, the customers would not develop trust in the organization. For example, Dr. Chung argued that one major reason that DHL has gained trust from customers worldwide is that DHL people always deliver goods or packages on time. Therefore, trust is established based on the strong competence of DHL in delivery services. For example, in his book entitled *Designed to win: What every business needs to know to go truly global* [44], Dr. Chung wrote:

"The Founders started a company that people trusted enough to give their most important documents to – they were trusted by individuals, banks, shipping companies, and trading companies. That trust was built on two things – speed and accuracy – as well as DHL's growing positive reputation. The best sales referrals always come from somebody in the same chain. For example, if DHL was courting a banker, we would suggest that the banker checks with the CEO of American Express for a recommendation of DHL's services. When the banker asked the Amex CEO – 'What do you think of DHL?' – they would hear that Amex had been using us for a reasonable amount of time. DHL was highly recommended due to our speed, reliability, and professionalism. At that time, DHL didn't realize that the reliability, not just of delivering on time, but also picking up at the same time every day, using the same courier, was so important to our customers. In fact, it defined us and differentiated us from all other transportation services."

The second factor influencing the development of trust is the moral character of the person. According to Dr. Chung, moral character of a service leader is the key determinant of trust between the leaders and the followers. For example, he claimed: “people trust you because you behave correctly and appropriately.” The moral character and behavior of a leader could develop in others a strong sense of trust, which helps leaders attract and retain high-quality followers. According to Dr. Chung, Chinese and Western cultural foundations share some moral principles and standards. Leaders who behave based on these moral standards and principles would develop trust in relationships with their followers. As argued by Dr. Chung in the interview:

[Among] the ten commandments, the first three are talking about God; the fourth to the tenth regulate how people have to behave or not behave if they want to live together as a community, for example, “don’t steal, don’t lie, and don’t cheat,” ...And now we compare it with Confucianism. We can see Confucian moral principles as the positive ones “*xiao, ti, zhong, xin, li, yi, lian, chi, zhi, ren, yong, shu*” (“filial piety, brotherly love, loyalty, truthfulness, propriety, righteousness, integrity, shamefulness, wisdom, benevolence, courage, forgiveness”). I talk about the ten commandments when I talk about ethics and characters, saying that you should not do these. These are the things, if you do, people will move away from you. And if people hear enough about these behaviors and there is a pattern, then you have a bad reputation. People don’t trust you, they don’t do business with you, and you stop being a leader.

Dr. Chung used a personal operating system to explain the importance of an individual’s moral character. The personal operating system comprises a person’s beliefs, values, and all other factors that shape the person’s character. A person’s moral character guides his/her behaviors. Dr. Chung believed that one person’s trust in another person is because he/she believes that another person would not do immoral things that hurt him/her.

The third influencing factor to trust-building is care. Besides competence and moral character, Dr. Chung also argued that leaders’ care could build trust between leaders and followers. All in all, he perceived that trust-building is determined by the three Cs of service leadership altogether but not by one single factor. As illustrated in his book entitled *12 dimensions of a service leader* [39]:

The key ingredients behind a great service leader are his or her 3Cs of Competence, Character, and Care. By making each one as strong as possible, the intersection of the 3Cs is our leadership potential. This is also the building block for establishing and maintaining our level of trustworthiness. Let’s also narrow things a bit and look at the tribe of the classroom, an environment where someone wants to emerge as a leader. Again, this leadership is a service you would be delivering to fellow students through a healthy blend of Competence, Character, and Care. In exercising this over time, the classmates will reinforce their acceptance and trust, which build self-esteem in the leader.

Theme 3: Importance of Trust in the Service Economy

Dr. Chung’s written work and interviews highlighted the importance of trust in leadership in the service economy. First, trust differentiates “a leader” from “a manager.” The manager’s function is mainly based on job duties, payment, and positions. This “functional” relationship is ineffective in gaining followers’ long-term loyalty and commitment and empowering followers to perform at their best or even beyond expectation. Therefore, a leader needs to build trust with followers, thus promoting stronger and closer bonds with followers. For example, Dr. Chung said in the interview:

The definition of a leader is separable from that of a manager. If I am a manager and you are my employee, you have no choice but to work for me because I pay your salary. However, if I am a leader and you are my follower, our relationship is not defined or shaped by money. If there is no trust, followers can leave and find somebody they can trust to follow. I believe that if you want to do something well, you need good followers. If you have many followers, but their service standards are not acceptable, your whole team performs poorly.

Second, trust between leaders and followers plays a vital role in delivering the best services in the service economy. Dr. Chung mentioned that to deliver the best services, frontline employees need to have strong initiative and autonomy to make on-the-spot decisions, which requires leaders' trust in employees. Dr. Chung explains this in his book [44]:

As we have discussed above, trust is fundamental to service network leadership. Your followers have to trust you if they're going to exercise autonomy and take the initiative – which they have to do, given the distributed, decentralized nature of the operation. And you need to trust your followers to do this, given that a service network can only work through such decentralization.

Theme 4: Outcomes of Trust

Two outcomes of trust were identified based on the interview data in the SLT. The first outcome is the employees' sense of fellowship and ownership, which would further maximize their work performance and service quality. This was articulated by one of Dr. Chung's colleagues in the interview:

Trust has been an important element of the culture of DHL. When I received an urgent delivery task in Hong Kong [and needed to deliver the package to the United States], I trusted my colleague in the United States who would deliver it to the customer. If I had any special request, I would tell him by telex or long-distance phone. I did not need to be worried about whether he would do it well for me because he would. And vice versa, if I receive his request, I will do everything to ensure that I can fulfill my commitment to him. He does not need to be worried either. I will tell him after completing the task. This is normal practice in DHL. The trust was built at a very early stage and then gradually became DHL's unique culture. When I promised our customers and told our overseas DHL colleagues, I could rest assured. When traveling overseas, we were very relieved as long as there were DHL offices. No matter what happened, we could always seek support from the local DHL office. This kind of trust is built in our hearts, and we also will perform this trust ourselves. (Colleague A)

The second outcome of trust is the followers' strong organizational commitment. An organization with a strong culture of trust would gain business success and followers' commitment because it appeals to human values. To trust and to be trusted are fundamental human values that sustain and shape social behaviors. Therefore, establishing a "trust" culture among the whole organization is vital for enhancing followers' commitment, loyalty, and identification to with organization. This was also illustrated by the interview with Dr. Chung's former colleagues in DHL:

Company culture must appeal to some personal values because we all want others to trust us and respect us. This is very fundamental. If you could repeat these things in your company's environment, people would naturally feel comfortable there. Otherwise, you are against some of their values. (Colleague A)

DISCUSSION

In this study, we attempted to obtain an in-depth understanding of the concept and idea of trust in service leadership based on in-depth interviews with Dr. Chung and his former DHL colleagues, Chung's written work, and the existing leadership literature. The paper has some features. First, the paper is pioneering in using an integrative approach combining qualitative data and literature review to explore the concept of trust in the service economy. One unique feature of qualitative research is its "richness" in describing and interpreting a phenomenon [45]. Second, this paper explores the meaning of trust in the SLT. Although the existing literature has investigated trust in different positive leadership theories, limited research has investigated the role of trust in the SLT. Third, this paper explores trust in the Chinese context, which enriches our current understanding of trust in leadership across different cultures.

Definition and Nature of Trust

Both interview data and literature regard "showing vulnerability" as a key element of trust. It is based on the belief that another person will not do harmful things to him or her. Therefore, trust is not regarded as an inborn trait, but a psychological state influenced by environmental factors. The literature suggested two types of trust, which are cognitive and affective oriented [6, 11]. Cognitive trust is developed based on rational assessment of the leader's competence and moral character. Affective trust is built on leader-follower emotional connections. Among the three types of trust proposed by Dr. Chung, competence-based and character-based trust could correspond to cognitive trust, and care-based trust could correspond to affective trust. Besides, according to Dr. Chung, trust is a system determined by the interactions between different determining factors.

Determinants of Trust

In line with the existing research, results demonstrated the importance of leaders' qualities in building trust between leaders and followers. These qualities include competence, moral character, and care, promoting different types of trust. First, domain-specific competence of leaders promotes trust between followers and leaders. Competence-based trust could be established when one person perceives another person capable of performing a task professionally. Dr. Chung also considered the company's strong competence in delivery service a key reason for DHL being trusted by customers. In the literature, Mishra [26] listed leader competence, such as the capability to make sound and professional decisions, as an important factor of followers' trust in their leaders. Besides, literature also suggests that trust could be built on leaders' generic competence, such as interpersonal competence [7]. Therefore, both domain-specific and generic competence could help to promote trust.

The second determinant of trust is moral character. In line with the existing literature, this paper highlights the importance of moral character of leaders in building trust between leaders and followers. Leaders with moral characters would treat their subordinates fairly,

communicate with them openly and honestly, care about their welfare and interests, and promote their higher levels of trust in leaders [19]. Besides, moral character such as integrity and behavioral consistency could provide a certain level of predictability, which helps subordinates cope with uncertainty [46]. Although the existing literature suggests the important role of moral character of leaders in shaping trust, it mainly focuses on specific moral character attributes such as integrity, honesty, or loyalty [25-27]. Dr. Chung's ideas add value to the existing literature by arguing that leaders' moral character as a whole determines followers' trust in leaders.

The third determinant of trust is the care of a leader. Scholars have proposed that benevolence is an important determinant of trust in leadership, which refers to leaders' concern for the needs, interests, and well-being of followers [7, 27]. This corresponds with Dr. Chung's idea that trust could also be established based on followers' perceived care and love of leaders. Finally, Dr. Chung's perception of determinants of trust goes beyond the existing literature. He states that trust development is a system in which the three determinants interact and shape the followers' trust in a leader.

Outcomes of Trust

One outcome of trust in service leadership is the development of employees' sense of fellowship and ownership. As pointed out by McCulloch [47], fellowship has elements such as identification, cohesion, sense of membership and responsibility. The sense of fellowship is vital for individuals and organizations. It manifests the values and responsibility shared by members of a group [47], which are vital for organizational success in the service economy. Besides, employees possessing a strong sense of ownership would do their best in their positions or even perform beyond their job requirements to best satisfy the needs of customers [48, 49]. Furthermore, this paper illustrates that trust-building is fundamental because it pertains to "human values." Followers having a strong trust in leaders would demonstrate strong organizational loyalty and commitment, which contribute to higher performance and long-term success. This is in line with the existing literature, which shows that high levels of trust would benefit a wide range of individual and organizational outcomes [3, 29].

Although this paper adds value to literature by focusing on the importance of trust in a service-oriented economy, there are limitations of this study. First, this study only involved Dr. Chung and two senior colleagues in DHL as three key informants. Multiple informants in DHL, such as leaders, employees, and other stakeholders, should be recruited to understand trust in the service economy. Besides, interviewing successful service leaders in other service companies would enhance the richness and validity of the findings. Second, as this paper only employed interview and document analyses as the major data-collection tools, other data-collection tools in qualitative methodology such as field observations can also be employed to further validate the findings of the paper.

Chapter 154

SELF-LEADERSHIP IN THE SERVICE LEADERSHIP THEORY

***Wenyu Chai, PhD, Daniel T. L. Shek*, PhD, FHKPS, BBS, JP
and Diya Dou, PhD***

The Hong Kong Polytechnic University, Hong Kong, PR China

ABSTRACT

The economy in many countries has been transforming from a manufacturing economy to a service economy. The service economy requires service providers to have strong self-leadership to direct and improve oneself and make on-the-spot decisions independently before leading others. Although existing research has demonstrated the importance of self-leadership to both individuals and organizations, there is a need to examine self-leadership in the service economy based on the service leadership theory (SLT) proposed by Dr. Po Chung (co-founder of DHL International). With reference to the existing literature on self-leadership and the SLT and interviews with Dr. Chung and his former colleagues in DHL, we examined the nature and outcomes of self-leadership in the service economy according to the SLT. Besides, we explored strategies to improve self-leadership based on DHL practices. This study emphasizes the significance of cultivating and practicing self-leadership in the service economy and highlights practices adopted by DHL International to improve self-leadership in organizations.

INTRODUCTION

Self-leadership can be regarded as a starting point for fostering work performance, improving personal well-being, and achieving personal development [1, 2]. One needs to constructively improve self-leadership before successfully leading others [3]. The concept of self-leadership can be understood in terms of behaviorism [4] and social learning theory [5].

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

In this way, self-leadership is regarded as a set of learned behavior skills, which can be trained and improved [6]. Despite of the positive influence of self-leadership on individuals and organizations, most extant leadership models focus on leading others rather than leading oneself [5].

Conceptualization of Self-Leadership

The concept of self-leadership has been defined in varied ways. Self-leadership is grounded in several self-influence theories, including self-regulation [7], self-management [8], intrinsic motivation theory [9], and social cognitive theory [5]. However, the concepts of self-leadership, self-regulation, and self-management are different. On the bottom of self-influence is self-regulation, consisting of self-observation, self-evaluation, and self-reaction [10]. The concepts of self-regulation and self-management mainly focus on managing behaviors to meet external standards. On the contrary, self-leadership adopts a broader perspective, stresses intrinsic values and motivational potentials, and acknowledges the external rewards associated with performing tasks. Thus self-leadership includes the concepts of self-regulation and self-management [11]. As defined by Manz [11], self-leadership refers to “a comprehensive self-influence perspective that concerns leading oneself toward the performance of naturally motivating tasks as well as managing oneself to do work that must be done but is not naturally motivating” [11].

Neck, Stewart and Manz [12] regarded self-leadership as a process, including self-motivation and self-direction to effectively complete tasks. Self-leadership strategies include three types of strategies [13]. First, behavior-focused strategies emphasize behavioral change through self-regulation and attention, such as self-observation, goal setting, punishment, and reward. By cultivating desirable behaviors and prohibiting undesirable behaviors, these strategies are specifically useful in managing behaviors to complete unpleasant but necessary tasks. Second, natural reward strategies include creating enjoyable and delightful features into tasks and shaping one's feelings of the tasks [14]. These strategies would enable individuals to accomplish tasks based on intrinsic motivation. People are rewarded by completing tasks and would feel gratified during the process. The strategies would increase perceived self-determination and competence, which are the two fundamental elements of intrinsic motivation [15]. Third, constructive thought pattern strategies concentrate on setting up thought patterns in desirable ways. These strategies include analyzing and improving belief systems, managing self-dialogue, mentally imagining possible results of behavior to be taken, and using positive scripts to replay the ineffective ones [16, 17]. Constructive thought pattern strategies are effective mechanisms to enhance the thinking process and behaviors for goal-setting and goal-accomplishing [18].

Besides the three self-leadership strategies, scholars also identified specific personal factors or qualities that could promote self-leadership, such as self-directed learning readiness [19] and reflexivity [20]. In addition, Rose [21] argued that the process of self-leadership includes a positively reinforcing cycle, including self-esteem, self-concept, self-confidence, positive attitude, self-motivation, and positive behavior. Starting from self-esteem and self-concept, each element in the process would strengthen the following element. Therefore, in this self-leadership model, self-esteem, self-confidence, and self-concept are contributors and consequences of self-leadership.

Self-Leadership, Psychological and Physical Health, and Job Performance

Self-leadership can foster self-motivation and self-direction through different behavior- and cognitive-focused strategies [13]. Existing literature suggests that self-leadership would benefit individual development, including psychological health, physical health, and work-related positive outcomes. First, research has shown that stronger self-leadership would promote individuals' psychological health. Several experimental studies revealed that self-leadership training could promote individuals' self-efficacy and positive affect [17, 22]. Dolbier, Soderstrom and Steinhardt's [23] research showed that self-leadership was positively associated with employees' psychological functioning, psychological well-being, and physical well-being. Research also found that self-leadership would increase self-efficacy and positive affect, consequently strengthening stress-coping abilities and reducing stress [24, 25]. Furthermore, Rose [21] argued that self-leaders would possess self-esteem and self-confidence. Godwin, Neck and D'Intino [26] proposed that self-leadership strategies could enhance one's spirituality.

Previous research also revealed the positive impact of self-leadership on work-related outcomes, such as employees' job satisfaction, commitment, and work performance. For example, Bailey, Barber and Justice [27] found that self-leadership predicted a 4% increase in job performance at the individual and organizational levels. Similarly, Hauschildt and Konradt's study [12] revealed that strong self-leadership could promote individual and team proficiency. Besides, studies conducted in different fields, such as nursing and education, have consistently shown that self-leadership is associated with higher job satisfaction and lower turnover intention [28]. Lovelace, Manz and Alves [29] suggested that introducing self-leadership into the working environment can facilitate healthy regeneration and engagement, leading to a greater feeling of control and a more active working environment.

Besides bringing positive work-related outcomes, self-leadership can help reduce stress and improve coping skills. Individuals with self-leadership can analyze the stress situation based on their available resources and capabilities and figure out solutions. Houghton and colleagues [30] argued that self-leadership strategies could help individuals effectively cope with stress in life and working environments. Wang, Xie and Cui [31] found that all three self-leadership strategies were positively associated with positive stress coping.

Self-Leadership and Leadership Development

Although different theories have discussed definitions and strategies of self-leadership, little research has focused on the role of self-leadership in leadership development. Only limited studies have revealed that self-leadership is the foundation for the development of positive leadership capabilities. For example, Cunha et al. [20] argued that self-leadership is a prerequisite for leaders to lead and influence others. Besides, self-leadership was found to predict positive leadership styles, such as transformational leadership, but negatively predict undesirable leadership styles, such as laissez-faire leadership [32]. Another study also found that self-leadership based on behavioral-focused strategies positively predicted transformational leadership [33]. Also, research showed that leaders using behavioral-focused self-leadership strategies would demonstrate more positive leadership behaviors [34].

Research Gaps

The existing literature on self-leadership has mainly focused on the theoretical discussion and expansion of self-leadership strategies. Besides, self-leadership is often regarded as a process but not a personal quality. The theoretical discussion and empirical exploration of the role of self-leadership in different leadership paradigms are also scarce. Notably, the service economy calls for new leadership paradigms, such as service leadership. However, questions such as how self-leadership is related to service leadership and what roles self-leadership plays in the service leadership process remain unanswered.

The emergence of service leadership responds to the increasing dominance of the service economy in many countries and areas. For example, the service sector's contribution to Hong Kong GDP was 92.2% of GDP in 2009 and reached 93.1% in 2018 [35]. Hong Kong's economy has been dominated by service industries, including banking services, international trades, real estate services, tourism, convention, and exhibition services. The service economy sets new requirements for service providers. Knowledge and skills become the input of production, and service is the "product." The service process involves human interactions between service providers and service recipients. Service providers' knowledge, attitudes, characters, and intrapersonal and interpersonal competences become the key to high-quality service. Leaders are required to have high quality and strong soft skills to motivate and inspire followers. Given this leadership paradigm change, Dr. Chung, the co-founder of DHL International and the Chairman of HKI-SLAM (Hong Kong Institute of Service Leadership and Management), proposed the "Service Leadership Theory (SLT)." Based on Dr. Chung [36], service leadership refers to "satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, groups, communities, systems, and environments." Effective service leadership is determined by three qualities of service leaders: competence, character and care [37]. The service leadership paradigm emphasizes both the "being" and "doing" of leaders. In particular, the "being" of leaders is vital as human assets become essential in a service economy. Attracting, motivating, and retaining high-quality employees become the core of leadership tasks. The service leadership paradigm holds several beliefs [37]. First, leadership effectiveness is not solely determined by possessing generic leadership competence but also by demonstrating character and care. Second, leadership is a "service," as leaders need to continuously improve their competence, character, and care to provide high-quality service to both themselves and others.

Research Questions

Based on the SLT, self-leadership quality is essential to service leadership's success. However, limited literature has discussed self-leadership in a service economy. Remarkably, no literature has systematically discussed the role and essence of self-leadership in the SLT. The present study aims to fill in the research gaps by discussing self-leadership in the service economy according to the SLT. This study tries to answer the following two research questions:

- 1) What are the conception and essence of self-leadership in the leadership context?
- 2) What role does self-leadership play in service leadership in the service economy?

OUR STUDY

The present study constitutes a part of a larger project on the SLT and service leadership education. The present study adopted a qualitative approach. The primary reason is that the qualitative approach, compared to the quantitative approach, allows more significant details into subjective meaning [38, 39]. Among different qualitative approaches, narrative inquiry enables researchers to systematically analyze and present people's voices and life stories through structured inquiry such as autobiographical writing and structured interviews [40, 41]. Given the nature and the objective of the study, we considered narrative inquiry an appropriate method.

Data Collection

Centering on the concept of self-leadership in the SLT, the present study inquired into the experiences and life stories of Dr. Chung and two of his former colleagues who had over 25-year working experience in DHL. As the founder of SLT, Dr. Chung was invited to share his stories regarding the establishment and development of the SLT and his interpretation of different dimensions of the theory via autobiographic writing and interviews. His colleagues were invited to attend two group interviews to unfold their service leadership experiences, including how self-leadership was structured and mediated in DHL practices. The interviews were designed to be semi-structured to provide greater space for informants to express and thus maintain the depth and flexibility of the data [42].

All the data were collected during October 2019 and May 2020. Informed consent to collect the informant's autobiographic writing, interview, and audio-record was obtained from each informant. Each interview lasted between one hour and two. Four out of seven interviews were conducted in Cantonese or with code-switching between English and Cantonese.

Data Analysis

The interviews were transcribed and cross-checked by a team of research assistants. The interviews conducted in Cantonese were translated into English. Thematic analysis was employed to generate patterns and identify themes. An initial round of data analysis was performed by three experienced researchers to identify the pieces of text that matched the focus of the study. One researcher carefully went through the text, generated initial codes and patterns, and further reviewed the codes and patterns to generate themes. The identified themes were sent to the other two researchers for peer-checking and then to the corresponding informants for member-checking. Based on feedback, the researcher revises, refined, and finalized the themes. This conduct was to improve the accuracy and credibility of the

analysis. Notably, the data analysis was also complemented by a review of works in the related field.

FINDINGS

Theme 1: Self-Leadership is an Indispensable Type of Service in the SLT

A distinguishing characteristic in the SLT is that it sheds light on the indispensable relationship between self-leadership, service leadership, and self-actualization [3, 43]. Core in this belief is that self-serving is a crucial type of service. Long-term self-management and self-improvement is the foundation and prerequisite for providing quality service in other service realms, i.e., the realms of others and systems [37, 44]. This core belief contrasts with many existing leadership models, such as charismatic leadership [45] and servant leadership [46], which do not show much concern for self-leadership. Some other leadership models, such as transformational leadership [47], allude to the notion of self-transformation and self-improvement but only conceive it as a pathway to effectively lead followers and overlook the service orientation towards the leaders per se. On the contrary, the SLT conceptualizes services as an integral system of different service orientations, in which self-serving is a crucial part:

“Leadership is a service aimed at ethically satisfying the needs of self, others, groups, communities, systems, and environments” [36]

“Service includes self-development efforts aimed at ethically improving one’s competencies, abilities, and willingness to help satisfy the needs of others” [36]

“A leader’s greatest self-actualization comes by helping everyone in his or her network to meet all their needs, including each person’s individual self-actualization” (Chung’s autobiographic writing)

“If you don’t take care of yourself, then everyone else who comes into contact with you won’t be happy or enriched by the experience of receiving your personal service” [48]

Reiterated in both the collected data and Dr. Chung’s publications is that service leaders should pay due attention to the balanced needs and development of others and themselves. It is a critical process during which individuals can realize their self-actualization.

Theme 2: Constant Practice of Self-Leadership Contributes to the Development of Service Leadership Attributes

The SLT is structured as a 3C model that incorporates the components of competence, character, and caring disposition in building up effective service leadership [49]. The theory perceives service leadership attributes related to the three components as trainable and malleable. Service leaders can develop those attributes through self-empowerment and self-improvement and by constantly aligning personal strengths with goals [3, 37]. These all point to the importance of self-leadership in service leadership development:

“The other thing is that care is trainable. It is like your muscle. You can train your muscle, and you can train your care. One way of care for training would be “awareness”. Awareness is very important. Being aware of it and then being aware that you can train your compassion and your care. I can give you a link, particularly about positive meditation. First, you have to care about yourself, so you close your eyes, you meditate, and then you feel that you care about yourself and then care about everybody around, in the room or in the family. And then if you do that, practice that for a while, then you feel that you are really contributing to the university, to Hong Kong, and to the universe eventually” (The fourth interview with Chung)

“You need to cultivate your morality, as Confucius said...you can’t be a person of disloyalty or a person who shows no righteousness or trustworthiness... I check myself every day. I check if I am loyal to my friends or if I practice what I have learned, right? This is self-serving. By doing this, you are doing your leadership. Most importantly, being a leader means cultivating your morality” (The fifth interview with Chung)

“There are many emotions that may be driving us, and depending on your personal make-up, you may need to focus on the management of specific emotions within you” [48]

“The thing that I can think of being directly connected to competence is continuous improvement...What is my observation? Those (capable) persons keep learning...” (The second interview with DHL staff)

The positive association between one’s self-managing/self-development (key components in self-leadership) and competence development has been identified and documented in many empirical studies [27, 50]. Notably, the excerpts above and Chung’s publications elsewhere make it explicit that the application of self-leadership should be extended from the “doing” dimension (i.e., leadership skills/competence) to the “being” (i.e., moral character).

Theme 3: Development of Self-Leadership Requires Self-Reflection and A Life-Long Learning Mindset

Practicing self-reflection allows one to give serious thought to his or her behavior and mentality, bringing clarity to the strengths and weaknesses of oneself [51]. The importance of introspection emphasized in the SLT resonates with Kanfer and Ackerman’s argument that self-observation, self-evaluation, and self-reaction underpin self-influence [10]. The importance of constant self-reflection and self-awareness to self-leadership is shown in the following excerpts:

“Becoming a better leader means developing your competence, character, and care, and for that to happen, you need to be self-aware. By being aware of the importance, ingredients, and paths to leadership, and are committed to improving, then this awareness followed up with action is a great recipe for improvement” [48]

“I involve in a lot of things every day. If I do not check my self-leadership every day, I will be sluggish” (The fifth interview with Chung)

Fostering a Life-Long Learning Mindset

It is highlighted in the SLT that the concept of self-leadership transcends self-management or self-regulation, which accents the influence of external rewards or recognition [3]. According to Dr. Chung and his formal colleagues, it is important for service leaders to be psychologically and mentally engaged in committing themselves to be life-long learners. In other words, they should be intrinsically motivated to pursue self-improvement and self-perfection [3, 11]. The transformation of mentality requires embracement of many qualities such as humility and curiosity, exemplified in the quotes below:

“In terms of being leaders, it is important for them to be equipped with curiosity and engage in continuous learning because you need to set examples for your followers. Only through continuous improvement, you can keep your credibility and professionalism as a leader” (The second interview with DHL staff)

“(After a business from Beijing) This experience really broadened my horizon...I told Agnes, ‘I realized there are so many things I don’t know’. I thought I was quite good before that, but when I was there, I found many lecturers and tutors were at the master level, using their own books or publications to teach us. I opened my eyes and realized I was not as good as I thought... But I was happy because it came to me that I was not that capable. After this, I would not say I was quite good. I learned to be humble” (The first interview with DHL staff)

“When it comes to how to strengthen and improve your mental dimension, the greatest single piece of advice I can think of is to commit yourself to the path of lifelong learning” [48]

Theme 4: Organizations Should Highlight a Culture That Cultivates Self-Leadership

An organization with a high level of autonomy and a strong sense of ownership creates a culture of accountability, flexibility, and empowerment [52]. In such a culture, employees have the propensity to make a positive transformation and achieve personal accomplishments [3]. To create this culture, employees should be encouraged to make their own choices and take ownership of their actions, and accordingly, leaders need to put trust in employees’ competence and minimize intervention to the delegated tasks. Second, leaders should allow employees to take risks and make mistakes and guide them to learn from the mistakes and treat mistakes as a pathway to self-improvement [53]. Based on the career trajectories as well as DHL practices, Dr. Chung and his former colleagues shared their views of the importance to boost such a culture for nurturing self-leadership:

“Make sure that the only mistake that they cannot make is a moral mistake, otherwise let them make a mistake...because when a courier is on the street, collecting documents and delivering documents, they are on their own. We did not have mobile phones at that time. They cannot call their supervisors and say: ‘what should I do?’ Also, if the supervisor has six people to supervise. If everybody calls the supervisor one phone call per day, the supervisor has six phone calls. And six supervisors, which means the manager has 36 phone calls per day. You cannot. So, what we teach them is autonomy, being able to make the best decision, being the best version of himself as a courier, best version of himself as a supervisor, best version of himself as an assistant manager. That’s what we try to do. Assistant manager should learn from all the mistakes from the courier, the supervisor and himself” (The first interview with Chung)

“...You have to explore the culture and values widely accepted by all, and then you build up them and make them flourish. For employees, this move can lead to a sense of ‘I find part of me in this environment’, which initiates their transformation. They will feel that they are not required to do work, but to do it out of their own choice...If they feel they are granted autonomy to make their own choices, they will be much happier and develop more sense of ownership. By making them feel a part of the work, you can bring about their transformation” (The second interview with DHL staff)

“The permissive culture of allowing non-moral mistakes was huge because anyone and everyone were allowed to screw up – including the boss – and no one lost face by making mistakes...With the ‘some mistakes are okay’ tenet, nobody felt the need to dig in to defend mistakes. The value of this was that learning from a specific mistake was adopted quickly and shared with the entire network through the channels of communication we had established” [53].

“(DHL) gave me many opportunities. Most senior staff wouldn’t run the whole show. For one thing, that would be too much to take, and second, you would leave others enough opportunities to develop. I found we were very confident because you believed in your confidence. Even for those things out of our league, your boss believed in your competence even more than you did. Imagine this” (The first interview with DHL staff)

Theme 5: Organizations Should Provide Wide Access to Learning and Development Opportunities

The DHL colleagues' narratives illustrated three ways of how DHL is committed to promoting life-long learning and development: First, DHL cultivated a self-leadership mindset by creating an environment where everyone engaged in skill-building, professional learning, and potential expansion through regular training courses. The courses were not designed for junior staff only, but also managers and executives. As trainers, the senior staff would need to learn how to teach and share better, update knowledge, and set examples for followers. Second, DHL also financed formal education to encourage systematic learning alongside work. Third, employees were rotated among various positions or departments to broaden their skill sets.

"...All department heads or above would have no other option but be nominated as trainer automatically. You would be trained as a trainer first, and as a trainer or facilitator, you need to lead your colleagues from your department and other departments too...We also had other regular courses (for the trainers) such as the management course, where the trainers would sign up, being trained by the training consultants, and evaluated their strengths...DHL built a culture like this. You would be assimilated by this environment, and even you were not the type of manager or executive before" (The second interview with DHL staff)

"In DHL, many would apply for further study because you would have a clear vision that if you hope to be a manager, you'd better have a degree. You should start from getting a degree if you couldn't do anything else (to improve yourself). Many of us did not graduate from high school, but they ended up getting a certificate, diploma, degree, and master's degree. Many, like Chan (pseudonym), she was our colleague. She was so diligent... She got one degree and two master's degrees here... She first started working after Year Six, but because of this environment (of DHL), she was encouraged to keep learning" (The first interview with DHL staff)

"DHL was a small company then. The bad news is you had to do everything on your own, but the good news is you could learn everything because of the blurred boundary. I remember we had to take calls, arrange the routes, and pick up mails... If we received a bill from the account, we would give it to the corresponding customer and ask for the payment. We would also do packing if got back early..." (The first interview with DHL staff)

DISCUSSION AND CONCLUSION

The present study explored self-leadership in the service economy based on the existing literature, Dr. Chung's autobiographic writing, and interviews with Dr. Chung and his two former colleagues in DHL. Some observations can be drawn from the results.

First, self-leadership is essentially a type of service that one provides to oneself for self-improvement and self-direction. Many leadership theories have mainly focused on the influence of leadership on employees' development but not leaders' own developmental and psychological needs, thus neglecting the importance of self-leadership. Based on the SLT, leadership is a "service" that one can provide to others as well as to "one's self." The notion of self-leadership in the SLT transcends the concepts of self-regulation and self-management, representing a broader perspective of the self-influence theories. As revealed in Chung's narratives, self-leadership is essential for service leaders to achieve "self-actualization." Dr. Chung also stressed the importance of self-reflection and lifelong learning in achieving self-leadership. Individuals with self-leadership can regulate their behaviors and intrinsically

pursue self-improvement [11]. Specifically, self-leadership will direct one's behavior to conform to social norms and requirements. Meanwhile, it will cultivate self-motivation to guarantee sustainability [13]. A service leader should devote to be a life-long learner [3]. Self-leadership can facilitate service leaders to maintain their credibility and advance their profession with the times.

Second, results indicate that strong self-leadership helps service leaders continuously improve their competence, moral character, and caring disposition, which are the three determinants of effective service leadership. Existing literature has mainly focused on the competence aspect of self-leadership in terms of managing one's behavior and thoughts to achieve specific tasks [11, 18]. However, as revealed in the results, the meaning and essence of self-leadership in the SLT go far beyond the traditional meaning of self-leadership. According to the SLT, self-leadership refers to a more comprehensive self-improvement or self-perfection process integrating the "doing" aspect (i.e., competence) as well as the "being" aspect (i.e., characters and care) of a person [37, 43]. Leaders with strong self-leadership tend to have a healthy body, strong minds, spirits, and the ability to satisfy others' needs. In other words, self-leadership does not solely aim to complete specific tasks but to achieve self-perfection and become a role model to influence others.

Third, although self-leadership is a self-serving endeavor, it does not only improve leaders' own leadership attributes but also benefits others and the system [37, 43]. Through self-improvement, service leaders can align their strengths and purposes with collective goals, use different strategies to improve themselves, and strive for excellence, which can further benefit organizations' function and performance. Shek and Lin [37] stated that individuals need to put great efforts to continually improve themselves before they can fully engage in serving the public. Constant self-leadership practice can enhance organizations' creativity, vitality, and team commitment [49]. Through self-leadership practice, positive interaction between co-workers and between leaders and followers can be established and enhanced, leading to an increase in individuals' belongings and organizations' development.

Fourth, results highlight some practices to improve self-leadership in organizations. The service economy requires service providers to possess high levels of independence, self-initiative, on-the-spot decision-making, and problem-solving skills. Service providers need to become "self-leaders" who could motivate themselves and make sound decisions independently. Thus, it is important to cultivate employees' self-leadership in organizations by establishing a supportive organizational environment. For example, grant a certain level of autonomy could develop employees' intrinsic motivation and self-leadership to achieve success in work performance. As mentioned in the interviews, when DHL frontline couriers have autonomy and the ability to use autonomy properly, they can make the best contingent decision on the spot. This experience will increase their self-worth, self-determination, and motivation. As more autonomy often leads to higher responsibility and accountability, employees may feel reluctant to use their autonomy or innovate. Thus, organizations may support employees' self-leadership practices by allowing their mistakes. For individuals, mistakes are the pathways to achieve self-improvement. Neck et al. [13] stated that self-leadership could boost self-motivation and self-direction in coping with behavior, affect, and cognition. Individuals with strong self-leadership can transform mistakes into precious experiences and improve himself or herself through this lesson. The effectiveness of self-leadership depends on the level of organizations' autonomy and the sense of ownership. To what extent individuals can achieve self-improvement is closely related to how leaders allow

individuals to take action on their behalf and make mistakes [52]. For organizations, allowing employees to make mistakes shows leaders' care at the situation, which would enhance relationships between leaders and followers and drive a harmonious organizational atmosphere [54].

Although this study integrates the writings of Dr. Chung and interview data collected from Dr. Chung and his colleagues, there are some limitations to this study. First, we only adopted qualitative methods in this study. It would be informative if quantitative data could also be collected and included in the analyses. Second, the information source was limited, as only three informants were involved. Involving more DHL staff at different organizational levels would help present a more comprehensive picture. Third, more empirical studies should be conducted to examine the impacts of self-leadership on individual and organizational outcomes in the Chinese context.

Despite the limitations, this study outlines the critical role of self-leadership in the service economy under the SLT. In line with previous studies, self-leadership is closely associated with positive employee outcomes in the service economy. These positive outcomes would motivate employees to provide high-quality services to themselves, co-workers, customers, and organizations, thus achieving individual and organizational success in the service economy. A supportive organizational environment, including personal training and policy, would promote employees' self-leadership.

Chapter 155

THE FUNG SERVICE LEADERSHIP INITIATIVE IN HONG KONG

Daniel T. L. Shek*, PhD, FHKPS, BBS, SBS, JP and Zi Yang, PhD

Department of Applied Social Sciences,
The Hong Kong Polytechnic University, Hong Kong, PR China

ABSTRACT

Although there are leadership programs in the higher education sector, most of them are elitist leadership models and rigorous evaluation is not common. With reference to the emerging leadership needs in the service economy, the Victor and William Fung Foundation initiated a program to support the universities funded by the Hong Kong SAR Government to develop Service Leadership education programs and curricula materials. In this paper, we introduce the background and nature of the “Fung Service Leadership Initiative” and the “Hong Kong Institute of Service Leadership and Management (HKI-SLAM).” We also present the work done by the eight universities. With particular reference to The Hong Kong Polytechnic University, we examined the evaluation findings supporting the Service Leadership education initiative. Finally, the contributions of the Fung Service Leadership Initiative and future challenges are described.

INTRODUCTION

In the last decade, the services sector has expanded tremendously in Hong Kong, contributing over 90% to the local GDP [1]. The variety of service industries in Hong Kong ranges from import/export, finance and insurance, public administration, and tourism to information and communication [1]. Labor in a service economy is no longer perceived as mere input, but as an interactive learning, development, and transaction process [2]. As a result, this service-oriented economic environment of Hong Kong constitutes a novel ecology for local graduates who are now expected to be armed with both the hard skills (e.g.,

* Corresponding Author's Email: daniel.shek@polyu.edu.hk.

specialized knowledge and professional skills), soft skills (e.g., intrapersonal skills), and good character (e.g., work ethics, trustworthiness) [3]. Researchers and educators have also developed a consensus that leaders with a service mindset are highly demanded in the contemporary Hong Kong society [4, 5]. However, the leadership programs in tertiary education in Hong Kong are often trait-based, overvaluing the leadership competencies and skills at the cost of adequately cultivating students' character, caring disposition, and service mindset [6, 7]. Besides, existing leadership programs in the higher education sector are mostly elitist leadership programs, assuming that leaders can only be generated from the "cream of the cream." This mode of leadership training actually reinforces the Hong Kong culture that only those who achieve academic excellence can serve as leaders. As Chung and Bell [8] argued, "our educational institutions and company training programs put so little planning, effort, or resources into teaching people how to succeed in the service economy" (p. 115-116).

Li & Fung Service Leadership Initiative (SLI) and the Hong Kong Institute of Service Leadership and Management (HKI-SLAM)

In response to the urgent call for a shift of focus on leadership education and practices in Hong Kong, Po Chung founded the HKI-SLAM in 2011 [9]. The mission of this institute is to join hands with interested communities, agencies, companies, and institutions to develop and strengthen service leadership learning and practices [9]. As highlighted in the conference booklet of the International Conference on Service Leadership Education in Service Economies (ICSLE) [10], service economy requires a new concept of leadership:

"The primary paradigm shifts embrace new ways of thinking about service, leadership, and service leadership. They are:

- Leadership is a service aimed at ethically satisfying the needs of self, others, groups and communities.
- Every day, people experience service and leadership opportunities. Everyone also possesses the potential to improve his or her leadership effectiveness and service satisfaction.
- The server is the service. Judgments about leadership effectiveness and service satisfaction are influenced by followers and customer experiences and judgments made about the competency, character, and caring social disposition of a leader or service provider.
- Service Leadership is about creating new personal service propositions and consistently striving to provide high quality caring service to everyone who one comes into contact with, including oneself" (p.4).

Before the establishment of HKI-SLAM, Po Chung had already embarked on conceptualizing a leadership model that allows a good alignment with the demands of a service age while incorporates traditional Chinese culture and values, where he assembled, reconstructed, and refined his 40-year experiences in the field of leadership and entrepreneurship [11]. In collaboration with other colleagues, Po Chung identified 12 dimensions of the attributes of an effective service leader [12]. His proposed model provides a theoretical framework for service leadership education. Notably, this leadership model does not only apply to the conventional service industries such as tourism and catering, but a

variety of modern service industries such as information and technology, education and financing [13].

The initial collaboration between the HKI-SLAM and the Victor and William Fung Foundation began as early as in 2011. This Foundation is a local-registered charity, which commits to promoting leadership development and thought leadership, as well as nurturing future leaders for the society. The collaborative effort was made to exchange ideas about how to promote service leadership through university courses and programs. In January 2012, the Victor and William Fung Foundation earmarked a grant of HK\$40 million to officially fund the Li and Fung Service Leadership Initiative (SLI) [14]. In the announcement on 15 January 2012, it is stated that:

“Hong Kong derives more than 90% of its GDP from the services sector, said Dr. Victor Fung, Chairman of the Board of the Foundation. ‘For Hong Kong to maintain its competitiveness in the prevailing trend of globalisation, we must maintain leadership in the Services Sector. In this regard, I believe our young people will benefit greatly from an education which will provide them with a good framework and hands-on experience to make a long-term commitment to Service Leadership.’ Dr. Fung also stressed that Hong Kong’s next phase of development, in the context of China’s latest 12th 5-year Plan, emphasises the development of the services sector.”

The Fung SLI represents a partnership between HKI-SLAM, the Foundation, and the eight public universities in Hong Kong, with all of them sharing the same vision of developing a curriculum to cultivate undergraduates into effective service leaders and maintain Hong Kong’s position as a global social leader [9, 14]. Each university was totally autonomous and could develop its own research-supported curriculum and materials as well as creating experiential learning opportunities for its students, which can include credit-bearing academic courses, non-credit-bearing programs, and extra-curricular activities. The curriculum should generally address the guiding principles and the values of the Service Leadership Theory (SLT), such as the 3Cs (competence, character, and care) of leadership, the belief that everyone possesses the potential to be a service leader, and the values of being a life-long learner [11]. Pedagogies that facilitate learners in applying, assessing, and questioning the values and beliefs in the SLT were encouraged [11].

As mentioned in the ICSLE [10], the collaboration amongst HKI-SLAM, Fung SLI and the universities is as follows:

“HKI-SLAM provides its SLAM curriculum framework and serves as the secretariat of the Fung Service Leadership Initiative. The Victor and William Fung Foundation provides catalyst funding and intellectual support. Each university provides a principle investigator and other supporting colleagues who participate in regular exchange of research findings about service leadership and in sharing ideas about how university education might help sustain Hong Kong’s reputation as a global service leader. This collaboration provides a unique curriculum development research platform for the universities. Each participating university is empowered to autonomously develop its own research-supported curriculum that is reasonably aligned with the SLAM framework and the unique needs of its students, the institution, and the communities the university serves.” [10]

ACHIEVEMENTS OF THE FUNG SLI

With the support of the HKI-SLAM and Fung SLI, the eight universities developed their own curriculum materials and projects with the aim of promoting service leadership education

(SLE) in the emerging global service economic ecology. While the focus is on service leadership, each university has complete academic freedom to develop its own education program and material. The current section presents the deliverables of the SLE in the respective universities based on their presentations in the 2016 ICSLE.

City University of Hong Kong (CityU)

The SLE program at CityU started from a small initiative which gradually developed into an expanded project entitled “*Project flame*” that involved 18 academic departments across the university, with the spirit of fostering social innovation and entrepreneurship [15]. “*Project flame*” offered a wide range of courses and extra-curriculum activities via four areas: “1) academic and professional education, 2) student service leadership, 3) incubation of social innovation, and 4) research and knowledge transfer” [16].

The academic and professional education aimed to combine traditional lecturing with innovative, practice-oriented teaching approaches such as study tours, seminars, and internships. Students were offered a variety of purposefully designed Gateway Education courses such as “*Make a difference: The challenge of social entrepreneurship in a globalized world*,” and “*Social innovation and entrepreneurial venture exploration*,” where their service leadership values and skills were expected to be fostered. Notably, CityU has also initiated the first Minor Program in Social Entrepreneurship in Hong Kong [15]. The second area, student service leadership, exposed students to direct experiences in service settings such as agency visits, and local and international internship programs. Students were expected to participate, observe, and have a critical reflection on social entrepreneurship via these activities. The area of “social innovation” incubation highlighted the development of students’ innovative ideas and practices. The last area of “research and knowledge transfer” underscored the sharing and application of ideas with the aim of laying groundwork for its future agenda in the field of SLE [16].

Hong Kong Baptist University (HKBU)

The SLE programs at HKBU had been implemented through the curricular and extra-curricular approaches [17]. The curricular approach mainly engaged students in a number of general education (GE) courses that emphasized interdisciplinary learning opportunities and dynamic interactions where students could learn from and for the community [18]. Between 2012 and 2015, HKBU had offered seven SLE GE courses to its students. A few examples of the GE courses are “*Service leadership and emotional intelligence*” offered by the Department of Social Work and Office of Student Affairs, “*Paths to service leadership in health services*” offered by Department of Religion and Philosophy and School of Chinese Medicine, and “*From responsible citizenship to service leadership*” offered by the Department of Religion and Philosophy. The GE office was also in close collaboration with other units at HKBU to launch service activities and events, such as sponsoring service trips and exchange programs [17]. Abundant extra-curricular activities were also provided to students as a supplement to the GE courses. For example, the “Be eager to learn, to care, to

lead” Series was a huge success. In 2015, this activity attracted 450 students to participate [17].

Lingnan University (LU)

The SLE at LU comprised six integral components. The first component was embedding service-learning projects in SLE. Since 2012, LU had developed seven credit-bearing service leadership courses that incorporated service-learning projects, namely, “*Corporate social responsibility, strategic management, leadership and teamwork, introduction to business, service leadership, social marketing, and services marketing*” [19]. By 2015, more than 600 students had taken part in the service-learning projects of the seven courses. The second component was comprehensive project infrastructure. Each project was operated by the following three phases for the sake of quality assurance, i.e., “the preparatory phase, the service phase, and the review phase” [19]. The third component was using self-report templates to guide students in completing self-review of their practices and attributes. The fourth aspect was formative evaluation studies. Drawing on the self-report data, LU had developed an eight-faceted model that attempted to promote students’ participation and ensure effective progress. The fifth component was extra-curricular service leadership practicums. The Office of Service Learning (OSL) provided students with internship opportunities and hands-on community engagement in NGOs, government organizations, social enterprises, etc. The final aspect was “discipline-based studies of service leadership in the commercial field” [19]. Both quantitative and qualitative discipline-based research had been carried out to examine the impact of the services on service recipients.

The Chinese University of Hong Kong (CUHK)

The SLE at CUHK had been undertaken in four areas [20]. First, a 14-week, credit-bearing GE course entitled “*Service leadership in an uncertain era*” was introduced to students. It contained four weeks of theory acquisition, eight weeks of showing examples of leaders from different spheres, and two weeks of synthesis. Second, the SLE team produced a series of video-assisted cases as a supplement to the traditional lecture-based teaching approach. Third, an SLE module was delivered through the “*I-CARE NGO internship program*,” where more than 20 undergraduates were offered overseas internship opportunities to practice services in NGOs and social enterprises each year. In this program, students could directly participate in addressing many social issues such as poverty and environmental protection. Finally, a social website was developed as a digital platform for the service leadership learning community to promote communication [20, 21].

The Hong Kong Institute of Education (HKIEd) Which was Renamed “Education University of Hong Kong” in 2016

In order to promote SLE, the Student Affairs Office (SAO) in the HKIEd launched the Project “*Achiever*” in 2012. As a co-curricular project, “*Achiever*” had attracted more than

1,000 student participants and accumulated more than 70,000 hours of learning between the duration of 2012 to 2015. It was consisted of a three-phase training structure. Students were first guided through a progressive learning process of building up fundamental concepts and knowledge (Phase One). Then students were encouraged to strengthen self-understanding by reflecting on their personal qualities (Phase Two). At the final stage, students were exposed to abundant experiential learning activities where they could apply knowledge and skills to improve service leadership and solve problems in a real-life context (Phase Three). A few examples of the experiential activities were “Intergeneration Learning and Elderly Service Academy,” “Leadership Enhancement and Development (LEAD) Programme,” and “Service Exposure for Global Awareness (SEGA) Programme.” Over 90% students reported positive perception of the learning experiences and enhanced leadership qualities [22, 23].

The Hong Kong University of Science and Technology (HKUST)

HKUST established a Service Learning Community (SLC) of three types of platforms, namely, platforms for service leadership apprentices, service leadership practitioners, and service leaders. The community was designed to meet the needs of students of different levels in terms of service leadership learning. The apprentice platform served as a starting line for beginners to increase their exposure to service leadership knowledge and values by displaying publications and videos and holding regular forums (e.g., EnG Chitchat). The platform also established customized workshops and activities to encourage students to learn. For the second level, the SLC developed a peer monitoring program (PMP) where senior students were offered the opportunity to become mentors to freshman after rigorous training and to practice their service leadership in the process. For the third level, several service leadership courses had been developed for students including a general course of “*Community service project: The way to success*,” and more technical courses such as “*Community service project: The mobile app development for hearing impaired children*.” These courses employed an interactive, multifaceted teaching approach that engaged students in actively serving local underprivileged communities [24, 25].

The University of Hong Kong (HKU)

In 2012, the HKU launched a credit-bearing Service Leadership Internship Program to promote SLE. It was initially designed for students in the Faculty of Social Sciences in the first three years, with more than 400 students participating in this project. Before embarking on the internship, students were required to attend several mandatory workshops to equip themselves with necessary knowledge and skills. Students then teamed up (groups of three to five) and worked in collaboration with community partners of HKU such as NGOs and social enterprises. During this process, student interns needed to commit as shared leaders as well as reflective learners, offering innovative solutions to real problems. Evaluation studies had also been conducted in order to assess students’ learning outcomes and program effectiveness. Results showed that students found their experiences in this program rewarding [26]. Since 2015, this program has been open to all faculties, with the objective to create a multi-

disciplinary setting, build up a synergy between students from different backgrounds, and adopt a team-based approach [26].

The Hong Kong Polytechnic University (PolyU)

With the support from the Fung SLI, PolyU had committed to nurturing service leaders by developing both credit-bearing subjects and non-credit-bearing programs since 2012. Two credit-bearing subjects were offered to students with different orientations in the design. For the subject entitled “*Service leadership (APSS1A21)*,” it aimed to equip students with the core values and concepts of the SLT, and guide them to the critical evaluation of existing leadership models. Concerning the subject entitled “*Service leadership through serving children and families with special needs (APSS2S09)*,” it integrated both classroom lecturing and the powerful pedagogy of experiential learning, providing services to underprivileged groups in different community settings. Besides the credit-bearing subjects, the SLE in PolyU went beyond the borders of Hong Kong to explore partnership with other higher education institutions and develop non-credit-bearing programs. For example, in 2015, 50 students joined the “Silk Road Youth Leadership Program,” which was co-organized by PolyU, Xi’an Jiaotong University, and Peking University to facilitate communication, hone leadership skills, and enhance social awareness [27]. In the next section, we will present the achievements of PolyU, including the subjects and programs developed as well as evaluation studies.

WHAT POLYU HAS ACHIEVED IN FUNG SERVICE LEARNING INITIATIVE?

The 3-credit subject entitled “*Service leadership*” has been offered in different delivery modes (e.g., APSS1A21 with classroom teaching mode, and APSS1A21U/V with blended learning mode that integrates e-learning and classroom teaching sessions). This subject aims to guide students through a variety of leadership models with special attention given to the SLT. It was designed to nurture students’ service leadership qualities and enhance the application in real life. With regard to the pedagogy, “*Service leadership*” highlights the innovative teaching approaches that include “reflective learning, experiential learning, and collaborative learning” [28]. Students are offered many opportunities to participate in structured experiential learning activities in class such as debate, drawing, role play and group presentation, building up an interactive environment where students can practice their leadership attributes. Students are also encouraged to demonstrate self-reflection on their leadership qualities in class exercise and written assignment to gain a deeper understanding of the theory as well as themselves [27]. The following learning outcomes are expected from students upon completion:

- a) “Understand the contemporary models of leadership with reference to the service sector, including their assertions, strengths and weaknesses;

- b) Demonstrate understanding of the basic leadership attributes intrinsic to effective service leaders;
- c) Reflect upon the need for developing the qualities of effective service leaders and their own leadership qualities;
- d) Appreciate the potential application of knowledge on effective service leadership gained in this subject to oneself' [28].

The Leadership and Intrapersonal Development (LIPD) Team, which designed and developed this subject, also actively pursue partnership with Peking University and Xi'an Jiaotong University in mainland China to promote SLE through curricular and extra-curricular leadership programs. In 2019 summer, the PolyU and Xi'an Jiaotong University jointly organized Service Leadership Summer School. During the two weeks, students from both universities completed the course tasks, acquired knowledge of the SLT and improved their service leadership qualities, while engaging in global perspectives and cultural diversity. We have also provided intensive training programs for students joining the leadership programs offered by the Global Youth Leadership Institute. In 2016, this subject was awarded the Bronze Award (Ethical Leadership category) in the Wharton-QS Stars Reimagine Education Awards [29].

The other subject entitled "*Service leadership through serving children and families with special needs*" (APSS2S09) is a 3-credit service-learning subject. It integrates classroom-based learning and community-based service learning, which were designed to facilitate students to obtain in-depth knowledge of the SLT, reflect on their leadership qualities, apply the core attributes during the service learning process, and enhance empathy and social awareness. Students taking the subject have served clients in NGOs, providing services for children and adolescents with behavioral and emotional problems, preschool kids with developmental problems, substance abusers and students experiencing social deprivation and disadvantage. In mainland China, PolyU students have also served migrant children and disadvantaged kids in Chengdu and Xi'an. In 2016, it won the Bronze Award for the category of social enterprise in the Wharton-QS Stars Reimagine Education Awards [30]. In 2018, together with three other subjects, this subject was awarded the UGC Teaching Award, which is the most prestigious teaching award in all public universities in Hong Kong.

This Service-Learning subject consists of three types of teaching and learning approaches: 1) Students are asked to complete the 10-hour learning modules online, 2) Students are required to attend the purposefully designed lectures, workshops, and seminars in person and 3) Students should team up and provide well-planned services as a group in one of the community partners. The intended learning outcomes are as follows:

- 1) "Address the needs of the service recipients through service delivery;
- 2) Link their service experiences with academic course materials;
- 3) Appreciate and respect people from diverse background;
- 4) Integrate academic learning (e.g., knowledge on service leadership) into the service experience and activities;
- 5) Demonstrate empathy and care by providing community service;
- 6) Apply the skills (e.g., active listening) and knowledge (e.g., moral character and competencies) they have acquired in university education to deal with complex issues in the service setting;

- 7) Reflect on their service leadership qualities through service learning;
- 8) Work effectively with different parties (e.g., students, teachers, families, and community partners) when preparing and delivering service” [31].

The community partners in which students can choose to serve include Society of Boys' Centres (serving students with emotional and behavioral problems), Christian Zheng Sheng College (serving clients with substance abuse and behavioral problems), Wharf's Project WeCan (serving students with social deprivation) [32]. In Project WeCan, for example, PolyU students provided customized activities to meet the learning needs of local secondary school students from disadvantaged backgrounds. Between 2017/18 academic year, 8,571 secondary students benefited from this program [33, 34]. In Christian Zheng Sheng College, a local drug rehabilitation school for youth, PolyU students engaged in daily routines as Zheng Sheng students did, and they also shared their life experiences with each other. By doing so, this service learning experience aimed to improve PolyU students' empathy and caring disposition [35]. The philosophy underpins the design is that service learning is an effective vehicle to strengthening service leadership qualities [33].

In order to assess the effectiveness of the service leadership subjects, systematic evaluation studies adopting both quantitative and qualitative evaluation methods have been undertaken to measure different dimensions of the program quality. Generally speaking, three evaluation strategies have been used to examine the impact of SLE, such as the knowledge, attitudes and behavior of the students taking the academic subjects or participating in the non-credit-bearing service leadership programs. First, objective outcome evaluation studies have been conducted to examine whether there are positive changes in the students after joining the program. Several studies have shown that students showed positive changes in their service leadership knowledge, attitudes and behavior as well as psychological well-being after receiving the service leadership education. In a study utilizing a quasi-experimental research strategy, research findings showed that students in the experimental group showed improvements in the leadership outcomes as compared to the control participants [36]. The second approach is subjective outcome evaluation. Several studies have shown that students joining the service leadership education initiatives had a very positive subjective evaluation of the service leadership subjects and programs, teachers and workers, as well as benefits of the program. Finally, qualitative evaluation based on focus groups, individual interviews, and written reflections of the students have also revealed the positive outcomes of the related subjects and non-credit-bearing programs. Generally speaking, the evaluation studies have provided ample empirical evidence that students perceived the service leadership subjects positively and were able to achieve positive changes in service leadership qualities and positive youth development qualities. Tables 1 and 2 present the data collected between the academic year 2012/13 and 2018/19 as well as the publications arising from SLE at PolyU.

One important observation based on the evaluation findings is that the Service Leadership education programs can promote the well-being of the program participants, including life satisfaction and psychosocial competencies. In a study adopting cross-lagged analyses involving 114 students [37], students' knowledge, attitude, and behavior on service leadership, life satisfaction and positive youth development attributes were found to be higher after taking the subject. Besides, cross-lagged analyses showed that positive changes in student well-being were significantly related to positive changes in students' service leadership attitudes and behaviors. This finding underscores the developmental impact of SLE

on the holistic development of students. This finding is important because there are views showing that there are worrying trends in the mental health issues of university students in Hong Kong [38, 39]. Obviously, Service Leadership education is a promising approach to promote holistic development of university students, including their psychological well-being.

Table 1. Data collected for Service Leadership subject/program between 2012/13-2018/19 by PolyU

Methodology	Measures	Data Collected
Objective Outcome Evaluation (Pretest-posttest Evaluation)	Well-being	Positive youth development (PYD) (31 items)
		Life satisfaction (5 items)
	Service leadership qualities	Self-leadership (5 items)
		Caring disposition (8 items)
		Character strength (15 items)
	Beliefs of service leadership	Beliefs of service leadership (6 items)
	Service leadership knowledge	Service leadership knowledge (10-50 items)
	Service leadership attitude	Service leadership attitude (20-132 items)
	Service leadership behavior	Service leadership behavior (19-20 items)
Subjective Outcome Evaluation	Students' perception of the subject/program	Perceived program qualities (10 items)
		Instructor qualities (10 items)
		Perceived benefits of the program (18 items)
Process Evaluation	Quality of program delivery	Quality of program delivery (13 items)
	Program adherence	Observers' ratings
	Program fidelity	Observers' ratings
Qualitative Evaluation	Students' perspectives towards the subject/program	Students used descriptors and metaphors to describe the subject/program
Focus Group	Students' experiences in the subject/program	Observational data

CONCLUSION

Several points can be summarized to describe the development of the Fung Service Leadership Education Initiative. First, as service economy is emerging in the globe including Hong Kong, there is a need to nurture leadership in service economies. Second, the 3Cs (competence, character, and care) in SLT are qualities that should be possessed by effective service leaders. Third, to help Hong Kong develop service leadership education, Victor and William Fung Foundation provided funding for the Fung SLI with the participation of eight UGC-funded tertiary institutions. Fourth, each university has full autonomy to develop its own service leadership education programs and curricula. As a result, the principle of “let the hundred flowers bloom” was fully maintained in the process. Fifth, great works have been developed in different universities which have promoted the development of SLE in Hong Kong. Sixth, with reference to PolyU, evaluation studies using different approaches showed that Service Leadership subjects could promote the service leadership qualities and well-being of the students. Seventh, Fung Service Leadership Education Initiative is an excellent vehicle to promote the leadership and holistic development of undergraduates.

Overall speaking, the Fung Service Leadership Education is an overwhelming success. Looking into the future, there are several challenges in the field of service leadership education. First, policymakers and educators must appreciate the transformation of the global economy and the need to have a new type of leadership who can play well in an “infinite game” [40]. Second, stakeholders have to change their mindset that every student can be a leader (i.e., believing that every young person has leadership potentials) which focuses on the

strengths and potentials of young people. Third, reflection on the teaching pedagogies should be promoted. In particular, emphases on experiential, reflective and collaborative learning should be promoted. Finally, there is a need to accumulate evaluation findings to further support the utility of service leadership education.

ABSTRACT

Since we think university students are the “cream of the cream”, it is important to ask whether they thrive well. To what extent can university students in Hong Kong develop in a holistic manner? How should we nurture university students to become the leaders and talents of tomorrow? As part of the general university requirements in Hong Kong is the leadership and intrapersonal development requirement, students must take one 3-credit subject on leadership and intrapersonal development. To meet this requirement, a subject entitled “tomorrow’s leaders” was developed and piloted twice in 2010-2012, and was offered to more than 2,100 students annually in 2012-2014. The design of the subject, curriculum materials, reflection of teachers and evaluation findings in connection with this subject are presented in this book.

INTRODUCTION

University students are commonly regarded as leaders of tomorrow and pillars of the society. In many societies, investment in higher education is a priority policy area. With the emergence of knowledge-based economies in the global contexts, the proportion of young people who can receive university education has increased tremendously in the past few decades, particularly in Asia.

With particular reference to Hong Kong, university students have been historically regarded as the “cream of the cream” in the society. Under the influence of the Chinese belief that academic excellence is the key to upward social mobility, Chinese parents place heavy emphasis on examination results and academic attainment of their children. Furthermore, as only 18% of high school leavers can enjoy subsidized university places provided by the Government, competition in public examinations is very intense in Hong Kong. Generally speaking, only those with good public examinations results can get a subsidized university place in the eight universities in Hong Kong funded by the University Grants Committee.

As university students are the “cream of the cream”, it is important to ask whether they thrive well. To what extent can university students in Hong Kong develop in a holistic manner? How should we nurture university students? Shek [1] pointed out there were several developmental issues in university students, such as mental health problems, political apathy and lack of psychosocial competencies. Shek and Wong [2] further argued that as adolescent developmental issues would not disappear overnight, it is important to address such issues and promote holistic development in university students. In a recent review of developmental issues in university students, Shek and Cheung [3] highlighted several developmental issues in university students. These included behavioral and lifestyle problems (e.g., addictive behavior, problematic sleep pattern and interpersonal violence), mental health issues (e.g., suicidal ideation and depression), lack of personal goals, materialism, and egocentrism. Some recent incidents also suggest that there is a need to consider how holistic development in university students can be promoted: university students who were anxious about their academic achievement set fire in the street after drinking; probably under the influence of mental disorder, a university student ran in the street without any clothes; shoplifting behavior in university students are not uncommon in Hong Kong.

Although curricular, co-curricular and extra-curricular activities can help to promote the development of university students, the use of formal curriculum to help university students is attractive for three reasons. First, if the subjects are to be taken by all students, it is consistent with the philosophy that “no student is left behind”. In fact, while allowing students to take personal growth subjects may give more flexibility to students, the needy students may not choose the related subjects. Second, credit bearing subjects can give students an impression that the subjects are important. Actually, students are usually required to take subjects which are considered to be significant by the university. Third, the provision of credits can motivate students to pay more effort in the learning process. If the subject is just a requirement without credits, students may be unmotivated to do well in the process. Unfortunately, credit bearing subjects on leadership and holistic youth development for university students are not widespread.

Modeled after the British model, the duration of undergraduate degree programs in Hong Kong had been three years until 2012. In line with the education reform in secondary schools, duration of the new undergraduate program became four years for the 2012/13 cohort of students taking the Hong Kong Diploma of Secondary Education Examination. Generally speaking, it was expected that the extra one year would be devoted to broadening the horizon of the students through General Education studies. In the new 4-year undergraduate degree program at The Hong Kong Polytechnic University, students are required to fulfill 120 credits for graduation. Amongst these 120 credits, 30 credits are within the area of General University Requirements (GUR) which attempt to promote critical thinking, communication, innovative problem solving, ethical leadership and lifelong learning attributes in the students.

One component in the general university requirements is the leadership and intrapersonal development requirement, where students must take one 3-credit subject on leadership and intrapersonal development. To meet this requirement, a subject entitled “tomorrow’s leaders” was developed and piloted twice in 2010/11 and 2011/12 school years (4-12). In 2012/13 and 2013/14 school years, the subject was offered to more than 2,100 students annually. The design of the subject, curriculum materials, reflection of the teachers and evaluation findings in connection with this subject are presented in this book.

“Tomorrow’s leaders” has several unique features. First, positive youth development approach is used as the conceptual framework. According to the positive youth development approach, it is important to develop the resources (particularly psychosocial competencies) of young people. Second, a wide range of positive youth development constructs including resilience, cognitive competence, social competence, moral competence, spirituality, interpersonal relationship, and self-leadership are covered in the subject. Third, instead of using traditional didactic lecture style, experiential learning activities with active student involvement are used. Fourth, reflective learning is strongly emphasized and there are many self-reflection opportunities for students. Fifth, collaborative learning is emphasized in the learning process. This provides a good opportunity for interpersonal communication and learning by discussing with others. Sixth, besides academic content, the subject also focuses on practical application of the concepts learned in the subject. Finally, through a series of studies using both quantitative and qualitative methods, evaluation findings consistently showed that students had positive views of the subject and they perceived the subject to be beneficial to their development.

With this book we earnestly hope that colleagues who are passionate about the holistic development of university students can understand and give further thoughts on how the

positive youth development approach can be utilized to promote the leadership and intrapersonal development of university students in Hong Kong. The attempt is valuable because there are few related subjects in different Chinese societies.

Some of the chapters in this book was published earlier in the *International Journal on Disability and Human Development* in 2016 (Volumn15, Issue2), and revised and adapted for this book with permission from the publisher Walter de Gruyter in Berlin.

ABSTRACT

In the leadership literature, emotional competence is commonly regarded as an important quality of an effective leader. In this chapter, the basic concepts and theories of emotional competence are introduced. The role of emotional competence in positive youth development and effective leadership is described. To help students appreciate the importance of emotional competence, a lecture on emotional competence was developed in a subject entitled "Tomorrow's Leaders" at The Hong Kong Polytechnic University. The objectives, intended learning outcomes, lecture outline and lecture materials are presented in this chapter. Issues regarding the teaching of emotional competence are discussed.

INTRODUCTION

Nowadays, employers have high expectations for potential employees. While professional and technical skills are important, employers place more emphasis on the “soft skills” of graduates. For example, employers are concerned about how well the graduates are able to communicate effectively, be innovative and think critically in the face of complex and competitive environments [1]. College students are not only expected to possess knowledge within their discipline, but also to understand what business values in order to improve their employment opportunities and request for higher wages. Indeed, top rated skills including collaboration, work ethics, communication, and critical thinking are suggested for entry-level employment [2-3]. With the emergence of service economies, university graduates are also expected to possess leadership skills cherished in the service sectors, such as intrapersonal and interpersonal skills.

Although employers stress the importance of non-technical skills, evidence shows a gap between the skills students possess and what employers need [4]. For example, employers value analytical skills and technical skills, which were rated significantly lower in terms of perceived importance by students [5]. Besides, college students often underestimate the importance of social and emotional skills and assume that mastery of their professional knowledge is sufficient when they enter the workforce [6]. This is supported by a recent study which showed that among the six top desired skills as rated by the employers, only team work was listed as the most important skill as perceived by a sample of college students [7]. According to Hodge and Lear [7], “this lack of preparation may be related to three factors including not listening to professors and advisors, lack of participation in class exercise, and an inability to transfer meaning from their experiences into choices that will impact their future” (p. 29). Instead of solely focusing on the intellectual development of students, more effort is warranted to provide and sustain initiatives for career preparation. In 2011/12 academic year, about 12,246 (81.4%) university graduates entered the job market [8]. Although the unemployment rate (1.8%) was low, it is important to help them understand the value of career-related skills that facilitates their long-term career success. These skills are critical to meet the demands for cognitive, emotional, and physical resources in a dynamic and complex environment and to make the right decision or choice in this ever-pacing world. A good example is the experience of a graduate student with an advanced academic degree (i.e., a master’s degree) who had very good academic results. He sent more than 200 application letters but even so did not succeed in finding a job and eventually had to rely on social security to meet his living expenses [9]. As university students studying in UGC-funded places represent only approximately 18% of the relevant cohort in Hong Kong, they can be regarded as leaders for the future of Hong Kong. What leadership qualities do tertiary institutions need to nurture? In the literature on positive youth development, there are views suggesting that psychosocial competence is very important for the optimal functioning of adolescents. By adopting the strength-based approach, young adults are considered as a community resource rather than problems which could be nurtured through their developmental assets [10-12]. For instance, the National Research Council and Institute of Medicine argued that personal and social assets in four areas (i.e., physical, cognitive, social and emotional/psychological) are important for successful youth development [13]. Similarly, Catalano and colleagues [14] highlighted 15 constructs that are vital to positive youth

development programs in order to help youths become thriving and successful adults. These constructs are resilience, behavioral competence, cognitive competence, emotional competence, self-determination, self-efficacy, prosocial norms, prosocial involvement, beliefs in the future, bonding, spirituality, clear and identity, moral competence, recognition for positive behavior and social competence. In general, the concept of positive youth development is aimed at providing opportunities for fostering positive developmental qualities in adolescents before they enter healthy and productive adulthood.

Emotional Competence as a Leadership Quality

Amongst the different psychosocial competencies emphasized in the positive youth development literature, emotional competence is an important attribute commonly mentioned by different researchers. Emotional competence refers to individual's ability to recognize, identify, and manage one's own personal and others' emotions [15-16]. Evidence shows that high emotion competence is associated with effective leadership, higher job satisfaction and greater customer satisfaction [17-19]. Students with high emotional competence were more adaptable to changes and reported greater satisfaction [19-20]. Students who are more social integrated are likely to have a better academic performance to receive social support, and have a higher level of psychological wellbeing [21]. This is particularly significant among females [22-23].

"Emotion is one of the most central and pervasive aspects of human experience" [24, p. 3]. Emotional intelligence, also known as emotional competence, includes the ability to perceive accurately through understanding and regulating one's emotions and to promote emotional and intellectual development [25]. House and Aditya [26] noted that emotional competence is an important trait for a successful leader. This is supported by Kemper [27] who posited that "for those in leadership position, emotional intelligence skills account for close to 90% of what distinguishes outstanding leaders from those judged as average" (p. 16). Interestingly, emotional expression is not an easy task for the human being. As pointed out by Ernest Hemingway, "a cat has absolute emotional honesty: human beings, for one reason or another, may hide their feelings, but a cat does not". Hence, how to hide one's feeling yet express it in a healthy manner is an important lesson to be learned.

"Tomorrow's Leaders" at The Hong Kong Polytechnic University

Recent educational trends focus on the holistic development of college students [28]. Educators argue the need to develop a wide range of intrapersonal and interpersonal skills among college students [29-30]. According to Hodge and Lear [7], "recognizing that students do not necessarily understand the importance of skills that are important to 21st century employers is a key indicator for faculty members...who are in charge of curriculum and the content of their classes... may be able to guide students through experiential learning exercise to value the skills employers value" (p. 39). Indeed, such skills need to be developed through collaborative learning rather than simply "talking about" it. This learning experience changes the paradigm by "putting a high responsibility on the student, viewing education as something

one engages in rather than something one obtains” [5, p. 10]. Given the importance of nurturing students to meet the needs of the society and acquire self-awareness skills, all students under the 4-year undergraduate degree program at The Hong Kong Polytechnic University were required to enroll a 3-credit bearing subject entitled “Tomorrow’s Leaders”. This subject was designed to develop students’ leadership capacities through introducing the qualities of effective leadership and providing structured learning experiences. The purpose of this paper was to briefly describe the design of a lecture that aimed at promoting students’ emotional competence. First, the rationale and intended learning outcomes were discussed. Then, different class activities were presented.

With the importance of emotional competence in the effectiveness of leadership, this lecture provides students with an overview of this concept and suggests ways to enhance that competence in meeting their daily challenges. In the first part of the lecture, Goleman’s [31] major components of emotional competence are presented. These include a) self-awareness: identifying and observing one’s own emotions; b) self-management: managing and regulating one’s own emotions; c) motivation: intention to achieve one’s own goal by monitoring his/her motion; d) social skills: the ability to adapt and interact proactively in social contexts, and e) empathy: the ability to take other’s perspective. In the second part of the lecture, the importance of emotional competence in personal and professional development is discussed. Lastly, various ways to promote emotional competence are suggested.

Lecture Content

The objectives of this lecture were to: 1) introduce concepts and theories of emotional competence; 2) help students understand the antecedents and consequences of emotional competence; 3) enhance students’ awareness of emotional competence; 4) examine the relationship between emotional competence and leadership; 5) provide ways to promote emotional competence, and 6) understand issues intrinsic to the relationship between emotional competence and leadership.

After taking this lecture, it is expected that students will be able to: 1) understand concepts and theories of emotional competence; 2) explain the antecedents and consequences of emotional competence; 3) reflect students’ own awareness of emotional competence; 4) examine the relationship between emotional competence and leadership; 5) generate ways to promote emotional competence, and 6) review issues intrinsic to the relationship between emotional competence and leadership.

The teaching methods of this lecture are varied, including lecture, group discussion, role play, and self-reflection. The lesson plan consists of four parts which are illustrated as follows:

- Part 1: Definitions and theories of emotional competence
 - Warm-up activity: “How do you feel today?”
- Part 2: Framework for emotional competence
 - Class activity: “Guess emotions”
- Part 3: Emotional competence and leadership
 - Class activity: “Expression emotions”

- Part 4: Conclusion
 - Self-reflection exercise: “Make a wish”

In Part 1, a warm-up activity is introduced first before the lecture begins. The purpose of this activity is to raise students’ awareness of their own feelings and emotions. Students receive a set of colored dots and they need to pick the dots with the color that best represents their emotion and stick them on their faces or hands (e.g., Red: Happy; Blue: Bored; Green: Sad; Yellow: others). Then, students are invited to share their feelings or thoughts with each other. The teacher debriefs the activity by raising students’ awareness of their own and others’ emotions. For example, “*Instead of using the colored dots, are you able to identify others’ emotions accurately?*” “*In what ways do you usually express your own feelings?*”

In Part 2, the Saarni’s [32] framework of emotional competence is introduced. According to Saarni [32], there are eight skills in emotional competence. These include: a) the awareness of one’s own emotions; b) the ability to be aware of and understand others’ emotions; c) the ability to take others’ perspective to understand others’ emotions (i.e., empathic involvement); d) the ability to use different words to express emotions (i.e., emotional vocabulary); e) the ability to cope with aversive emotions and life distress; f) the ability to control one’s emotions (i.e., emotional efficacy); g) the ability to communicate emotions within interpersonal relationship; and h) the ability to differentiate internal and external emotions.

To facilitate students’ understanding of theories, another class activity “Guessing emotions” is implemented. The purpose of this activity is to see how well the students can express and interpret emotions accurately. The teacher then distributes emotional cards to students (Appendix 1). Each group is asked to act out a given emotion without using verbal cues (i.e., different facial expressions, body gestures and postures). The rest of the students will try to guess the feeling being acted out. The teacher debriefs the activity by asking students whether they are able to identify other people’s emotions and to express one’s own feelings effectively and accurately. For example, “*Which emotion(s) is/are easy and difficult to guess? Why?*” “*How do you feel when you are being misinterpreted?*”

In Part 3, Goleman’s [31, 33] proposed emotional skills are discussed. In the model, it is argued that there are five domains of emotional competence. These include self-awareness (knowing one’s emotions), self-management (dealing with one’s emotions), self-motivation (driving oneself to achieve one’s desired goals), relationship management (interacting with others in a positive and ethical manner), and social awareness (recognizing feelings and emotions of others).

The teacher explains the relationship between emotional competence and effective leadership. According to Goleman [31, 33], there are five areas of emotional competence skills for effective leadership. These include self-regulation (conscientiousness, trustworthiness and adaptability), self-awareness (emotional awareness, self-confidence and accurate self-image), self-motivation (initiative, commitment and optimism), empathy (showing consideration to others, seeing others more important than others, and developing others) and social skills (helping followers develop positive affect and confidence, encouraging followers to express and generate new ideas, and managing conflict).

To improve students’ emotional literacy, another activity is introduced. In this activity (Appendix 2), students are asked to write down a list of words related to different emotions and draw the corresponding faces. At the end of the activity, the teacher conducts a poll and

examines how much emotions the students know. The teacher debriefs the activity by explaining the importance of emotional learning in our daily life. For example, “*How well do you manage your emotions when facing sudden changes?*” “*How do you respond when facing conflict with others?*”

In Part 4, the teacher discusses the importance of emotional skills in today’s complex and competitive world and suggests several ways for promoting emotional competence. The possible strategies include:

- Keep a journal to record things that make you angry and upset.
- Listen to your inner voice and understand your emotional as well as social needs.
- Be aware of signs, people and places that make you feel good and those that do not.
- Talk to your friends. Listen to their points of view on issues to see how they respond and react when facing similar situations. (What strategies would they habitually use when they experience strong emotions?)
- Use “self-talk” to regulate your emotions before the emotion is further triggered.
- Practice emotion regulation strategies that help decrease expressive behaviors (e.g., reappraisal, turns one’s attention to other things).

This lecture ends with asking students to review their own strengths and weaknesses based on Goleman’s five emotional skills. To encourage students to continuously improve their emotional skills in the future, they are asked to set up a goal for themselves by completing a worksheet (Appendix 3).

Theoretical and Practical Issues

There are several theoretical issues that the teacher can further discuss with the students. Primarily, while emotional expression is highly valued in the Western contexts, emotional inhibition is strongly emphasized in the Chinese culture (e.g., Confucianism, Buddhism and Taoism). In particular, forbearance and patience are emphasized in Chinese thoughts. Hence, how to integrate the notion of emotional expression in the cross-cultural context is an important task for theorists on emotional competence. Second, ecological factors influencing emotional competence should be further examined. In particular, how family upbringing affects one’s emotional competence is an important issue to be addressed. Third, as the emotional expression may lead to interpersonal conflicts, there is a need to explore the optimal form of emotional expression and how interpersonal conflict can be minimized with maximum emotional expression.

Practically, as Chinese people have difficulty in expressing emotions publicly, the teacher may consider different ways to encourage students to share their emotional responses. First, instead of class sharing, group sharing would be helpful. The teacher may also form dyads amongst the students to share their emotions. Second, self-disclosure of the teachers can encourage students to share their emotional experiences. Third, inviting students to write down their emotions and share amongst the students is another strategy to engaging the students. Finally, sharing of stories with emotional content would be helpful to students.

Apart from helping students understand their emotions, it is also important to help them develop skills to nurture their emotional health. Students should be helped to understand the factors influencing emotional health and how emotional health can be nurtured. Furthermore, when students share their emotions, they may be disturbed by such re-connection and disclosure. Hence, the teacher should provide suitable counseling if necessary.

From our teaching experience, it would be helpful to use novels to help students understand the different issues surrounding emotional competence. We have used “Tuesdays with Morrie” [34] to encourage students to think about how Morrie felt when he was ill. The following quotations were used to help students reflect:

“I give myself a good cry if I need it. But then I concentrate on all the good things still in my life...I don’t allow myself any more self-pity than that.” (p. 57)

“When I have people and friends here, I’m very up. The loving relationships maintain me...But there are days when I am depressed...I see certain things going and I feel a sense of dread.” (p. 70)

“What I’m doing now, is detaching myself from the experience....If you hold back on the emotions--if you don’t allow yourself to go all the way through them--you can never get to being detached, you’re too busy being afraid. You’re afraid of the pain, you’re afraid of the grief. You’re afraid of the vulnerability that loving entails. But by throwing yourself into these emotions, by allowing yourself to dive in, all the way, over your head even, you experience them fully and completely.” (p. 103-104)

ACKNOWLEDGMENTS

This work and the course on ‘Tomorrow’s Leaders’ are financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is equally shared by the two authors. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

APPENDIX 1.

“Emotion Cards”

**Without using words, please use facial expressions,
body postures or gestures to represent the following emotions**

Disappointed	Anxious
Excited	Angry
Embarrassed	Grateful
Guilty	Shame
Contented	Shocked

APPENDIX 2.

“Expressing Emotions”

Please write down an emotion word and draw the corresponding facial expression on each character’s face. Try to draw as many faces as possible

 <i>Sample:</i> HAPPY			
			
			

APPENDIX 3.

“Make A Wish”

1. Are you emotionally stable? What things or events would make you feel irritable or agitated? Please give an example or scenario based on your personal experience.

2. State one type of emotional competence skills that you hope to improve in the future. How can you achieve this? Write it down and *make a wish!* Share your wish with other group members.

ABSTRACT

Cognitive competence is an important quality for effective leaders. To help university students understand the importance of cognitive competence and develop this quality, a lecture on cognitive competence is designed and incorporated in a general education subject entitled "Tomorrow's Leaders." In this chapter we review the basic concepts and theories of cognitive competence and outlines its linkages with positive youth development and effective leadership. The objectives, intended learning outcomes for students, lecture outline and related materials of the lecture on cognitive competence are introduced. Some teaching and learning issues in relation to this lecture are also discussed.

INTRODUCTION

Cognitive competence is a basic survival skill and it has become more so in contemporary society which is characterized by rapid change and knowledge explosion in different fields. In recent decades, cognitive competence has attracted much attention from researchers [1]. With particular reference to the field of youth development, many studies have shown that cognitive competence significantly promotes adolescent physical health and psychological well-being [2]. In addition, youth risk behaviors, including substance abuse, Internet addiction, delinquent behaviors, and emotional problems (such as depression and anxiety) are negatively related to cognitive competence [3-6].

With specific reference to organizational behavior, cognitive competence is one of the most critical factors that determine one's working performance, job satisfaction, and leadership [7]. As such, how to nurture cognitive competence in young people and arouse their awareness of the importance of cognitive competence has become an urgent question for researchers and educators. Unfortunately, despite the fact that intellectual abilities are highly emphasized in both primary and secondary school education, relatively limited efforts are made for university students, few attempts have been systematically carried out to promote cognitive competence in young people [8].

This chapter introduces one lecture on cognitive competence development for university students in Hong Kong which is embedded in an interpersonal and intra-personal development subject entitled "Tomorrow's Leaders" at The Hong Kong Polytechnic University of Hong Kong. There are several parts in this paper. First, the definitions and concepts of cognitive competence are outlined. In the second section, a brief review of empirical studies that investigated the relationship between cognitive competence and other psychological constructs is presented. The third section of the paper provides an overview of the lecture on cognitive competence that is currently implemented in teaching for university students. Both the major content and activities designed for the lecture will be introduced. Finally, students' feedbacks and the instructor's reflections on teaching this lecture are discussed.

Concepts and Theories on Cognitive Competence

The term cognitive competence has been used interchangeably with intelligence by many researchers, while the former is considered more generic [9] as it avoids "prejudgment about the organization or generality of cognitive abilities" related to intelligence (p. 336). A survey of the scientific literature shows that there are a wide range of definitions for cognitive competence. A simple definition given in The American Heritage Dictionary [10] is the "capacity to acquire and apply knowledge" (p. 910). Similarly, in the Oxford English Dictionary [11], cognitive competence means "the ability to acquire and apply knowledge and skills." According to Merriam-Webster Online Dictionary [12], intelligence (cognitive competence) refers to "the ability to learn or understand or to deal with new or trying situations...the skilled use of reason...the ability to apply knowledge to manipulate one's environment or to think abstractly as measured by objective criteria." Basically, all the definitions of cognitive competence highlight the ability of individuals to acquire knowledge

and skills and the ability to transfer them to solve problems, i.e., the process of learning and application.

In addition to the definitions in the dictionaries, psychologists have proposed a variety of theoretical models to conceptualize the construct of cognitive competence [1]. In a broad sense, Catalano et al. [13] conceptualized cognitive competence as having two major components. The first one is “the ability to develop and apply the cognitive skills of self-talk, the reading and interpretation of social cues, using steps for problem-solving and decision-making, understanding the perspective of others, understanding behavioral norms, a positive attitude toward life, and self-awareness” [14]. The second component focuses on the ability to use logical and analytic thinking, and abstract reasoning which directly contribute to academic and intellectual achievement. In another popular model proposed by Fry [15], cognitive competence has three elements, including cognitive structure, cognitive processes, and overt behaviors, among which cognitive process is referred to as one’s metacognition, self-regulation, and cognitive skills of thinking, reasoning, analyzing problems, where information processing plays a critical role. Cognitive process affects not only one’s overt behaviors such as the real performance in solving problems and decision making, but one’s cognitive structure, like pattern of thoughts and knowledge structure [15]. According to Fry, cognitive competence is the ability to internalize, self-regulate, and transfer appropriate cognitive skills to construct knowledge and interpret the environment [15].

Another group of scholars considered the high-level ability that enables one to further develop and use one’s cognitive skills, what people called “metacognitive” skills or “metacognition,” as the key component of cognitive competence. According to Sternberg [16], metacognitive skills are higher-order executive processes used in planning, monitoring, and evaluating one’s problem solving. Similarly, Geiwitz [17] defined metacognitive skills as the capacities to monitor and guide the application of cognitive skills so as to obtain the greatest possible success. He further proposed several functions of metacognitive process: to facilitate an understanding of the problem and its parameters, to promote the search for effective solutions, to monitor the process of problem solving based on which to generate feedback, and to devise solutions for changing condition. While cognitive skills is involved in doing, metacognition is involved in choosing and planning what to do and monitoring what is being done [18, 19]. As such, it is believed that metacognitive skills determine the level of one’s cognitive competence as they guide the problem-solving process and improve the efficiency of goal-oriented behavior [20].

When the above models are integrated, cognitive competence can be regarded as having three basic elements: a) existing knowledge acquired through formal and informal learning; b) cognitive skills which together with knowledge help individuals to perform a specific cognitive task; and c) metacognitive skills, the high-level ability that enables one to further develop and use one’s cognitive skills to perform the task better. Borrowing Winter’s taxonomy of knowledge [21], cognitive competence may be best represented by a triarchic model: know what (knowledge), know how (cognitive skills), and know why (metacognitive skills).

Importance of Cognitive Competence for Young People

Good cognitive competence empowers young people in their educational, professional, and personal lives. Nowadays, one major purpose of high education is to train innovative thinkers in the ever-changing world. As such, cognitive competence is considered more important than ever [22]. One's capacity to think and solve problems in diverse contexts is vital for obtaining knowledge, developing understanding, and achieving quality performance. According to a recent report in Australia, employers in enterprises considered cognitive competence, particularly problem solving skills, an essential factor to success in their respective organizations, such as finding out creative solutions, showing independence and initiative in problem identification and solving, testing assumptions taking data and circumstances into account, and resolving customer concerns in relation to complex project issues [23]. In university education, it is necessary to provide students with various opportunities to engage in complex and authentic problem solving, encourage them to use knowledge in innovative and creative ways, and promote deep understanding.

In the literature, numerous studies have demonstrated that adolescents who were cognitively more competent had better developmental outcomes in various aspects. First, a high level of cognitive competence has been consistently found a significant and powerful predictor of school performance and academic achievement in different populations [24, 25]. Second, there is a positive relationship between good problem solving skills and one's physical health [26]. Third, researchers have reported that cognitive competence serves as an important protective factor for youth development. Cognitive competence has been associated with fewer problem behaviors, such as bullying and violence [27], unhealthy externalization and internalization problems, substance use, and delinquent behaviors [3]. Fourth, the development of cognitive competence leads to a reduction of emotional problems, including depression and anxiety [28]. Finally, studies have also shown that cognitive ability was the best predictor of leadership effectiveness [29, 30]. In the context of Hong Kong, there are research findings showing that higher cognitive competence was related to better positive youth development [31] and lower levels of adolescent problem behavior [32, 33].

A Lecture on Cognitive Competence for University Students

In view of the developmental issues in university students in Hong Kong [34], Shek has developed a subject entitled "Tomorrow's Leaders" at The Hong Kong Polytechnic University based on the premise of universal prevention in the public health approach and the literature on positive youth development [35]. The subject aims at promoting leadership and intrapersonal competencies in university students. The subject was successfully piloted twice in the 2010/11 and 2011/12 school years. Utilizing multiple evaluation strategies including objective outcome evaluation, subjective outcome evaluation, qualitative evaluation and process evaluation, it was found that the subject was able to promote the holistic development of university students in Hong Kong [36-39]. Specifically, ten key positive youth development constructs are introduced in a total of 14 lectures for undergraduate students, with one lecture focusing on cognitive competence. The outline, content, and related activities of this lecture are presented in the following sections.

Overview of the Lecture Structure

To help students acquire an in-depth understanding of cognitive competence and its relationship with effective leadership, this lecture has five major parts. In the first part, the basic concepts and theories related to cognitive competence are introduced. Second, important factors affecting the development of cognitive competence and its consequences are summarized. The third part focuses on the relationship between cognitive competence and leadership with particular focus on metacognitive skills. In the fourth paper, different methods that promote the development of cognitive competence in students are introduced and they are encouraged to explore their own ways to facilitate cognitive development. Finally, a few reflective questions regarding cognitive competence are presented to help students reflect on their own cognitive competence and appreciate issues surrounding this topic.

Major Content and Activities

Before the start of the lecture, a warm-up activity is conducted to elicit students' interests in the topic. A series of interesting questions regarding different aspects of cognitive competence such as reasoning skills and creativity are presented to students and ask for their answers. For example, one question asks "how many animals of each species Moses took with him in the Ark?" This question actually tests not only one's previous knowledge about Bible, but also the ability to pay attention to details (i.e., it was Noah who took animals to the Ark instead of Moses), both of which relate to one's cognitive competence. Through this activity, students start to develop interests in the content of the lecture and become aware that cognitive competence is used in solving different problems.

The concepts and theoretical models of cognitive competence are introduced in the first part of the lecture. Based on numerous definitions proposed by researchers, cognitive competence was conceptualized as the capacity to acquire knowledge and skills and to transfer them when solving problems. In this definition, two cognitive processes including learning and application are highlighted. To further explain the construct of cognitive competence, a three-factor model comprising "know what," "know how," and "know why" is introduced. "Know what" refers to the knowledge acquisition, which include both the "Jump start" knowledge base acquired through intensive period of formal education in the earlier stage of life, such as literacy, basic mathematics, language, etc., and the refined wisdom gained through informal learning and experience, professional knowledge, as well as the process of knowledge integration. The second factor is "know how" which represents cognitive skills that are used for information gathering, building understanding, and productive thinking [40]. Examples that are closely related to students' lives are given to help them better understand the concept. For instance, people have different styles such as visual or sensing, sequential or holistic in learning; there are various skills in memorizing information like working with patterns and rules or developing meanings. The third factor is "know why" which is "metacognition." In the lecture, metacognition is explained as the process that people regulate and monitor the application of cognitive skills in problem solving, i.e., "thinking of thinking." Three steps involved in metacognitive process are also introduced to students with explicit examples: 1) understand the problem and its parameters; 2) search

for and specify effective solutions; and 3) monitor solution implementation, generate feedback, and make adjustment in the face of changing conditions. To facilitate students' understanding, a metaphor of constructing a house is used. While "know what" can be compared to the construction materials, "know how" is the construction workers who put bricks and cement together with their techniques to build the house, and "know why" is like the architect who makes the blueprint of the building, monitors the whole process of constructing, and makes sure the house can be built up with high quality. In real teaching, this metaphor works quite well in explaining the three-factor model of cognitive competence.

After this part of lecture, students are invited to participate in a group activity entitled "Survival in the wilderness." The purpose of this activity is to enhance students' understanding of how different components of cognitive competence play a role in problem solving. In this game, students are asked to imagine that they just survived in a crash of a small plane. Both the pilot and co-pilot were killed in the crash. It is winter in Canada and the crash site is in a forest area 20 miles away from the nearest downtown. They are all dressed in city clothes appropriate for a business meeting. Then 12 items are provided to students and they are asked to pick up five most important items in order to save themselves. In groups, students are also required to list the reasons why they choose the five items on a worksheet (Appendix 1) and then share in class. After students' sharing, the teacher will show the recommended answers by a military survival trainer and share the reasons. Using one or more items as example, such as the multiple uses of a can of Tuna, the role of the three components of cognitive competence ("know what," "know how," and know why" in the decision-making process will be further explained.

In the second part of the lecture, factors affecting cognitive competence and its consequences in different aspects of individuals' life are highlighted. From an ecological perspective, two groups of influential factors that determine one's cognitive competence are discussed: biological factor and environmental factors at various ecological levels. Particularly, the interaction between biological and environmental factors on the actual level of cognitive competence is discussed. In addition, the role of attention in perception and problem solving process is explained supported by a few interesting examples, such as illusive pictures and videos.

The third part focuses on the relationship between cognitive competence and leadership. Students are provided with research findings that investigated the effect of cognitive competence on different leadership qualities. More importantly, the functions of metacognitive skills in effective leadership are emphasized in terms of several aspects: 1) choose and plan what to do and monitor what is being done [18]; 2) guide the problem-solving process and improve the efficiency of goal-oriented behavior [20]; 3) define the nature of the problem to be solved; 4) specify the most appropriate solution; 5) implement the chosen solution; and 6) monitor and evaluate the solution and its consequences [19]. Specifically, two thinking styles/strategies that help people to find out the best solutions to a problem including divergent thinking and convergent thinking are also introduced.

Two activities are then implemented to help students further understand what divergent thinking and convergent thinking are. The first activity is called "Guess what I have." Five different objectives are printed on five cards (Appendix 2). Five students are invited to come out as the respondents and each respondent is assigned one card. The task for other students is to guess the correct object on the respondent's card by asking "Yes" or "No" questions (e.g., "is it eatable?"). In each round, there are one respondent and two competing groups to guess

the answer. The two groups take turns to ask one question and the respondent can only answer “Yes” or “No.” The group which first calls out the correct answer wins the competition. After this activity, the concept of convergent thinking, i.e., to draw a conclusion / to find an answer by summarizing different pieces of information will be recapped. For the second activity, students are required to work in groups to think of as many uses of a paper clip as possible in a limited time. When time is up, each group will report in class the number of uses they have figured out. The group which names most uses of a paper clip wins the game. The teacher will then show students a webpage on which more than 150 uses of a paper clip are listed and wrap up the activity by reviewing the concept of divergent thinking. It is expected that students can better understand the two thinking styles for metacognition introduced in the lecturing part.

The fourth part proposes several methods for students to promote their cognitive competence development. Echoing the three components of cognitive competence, different strategies are suggested by the teacher. For example, to develop metacognitive skills (“Know why”), a four-step reflective writing practice is introduced. First, simply describe the experience happened. Second, try to list at least three reasons to explain why this happened. Third, write down pros and cons of this event particularly what meaning I can find in this experience. Finally, figure out what can be done to change the situation for the better [41]. The teacher will use personal examples to demonstrate the process of reflective writing. Students will also be encouraged to do a brief reflective writing in class to experience how reflective writing as a way to promote one’s metacognition and help one to face negative experience as well as to solve problems.

In the last section of the lecture, there is a review of the whole lecture, including the conceptual model, influential factors and consequences of cognitive competence, its relationship with leadership, and ways to improve cognitive competence. Furthermore, a list of reflective questions is provided in order to help students reflect on their own cognitive development, consider possible methods they can use/have used to promote cognitive development effectively, and link the topic to their real lives.

Student Feedbacks and Teacher Reflection

In the 2012/13 school year, nearly 2,100 Year 1 students in The Hong Kong Polytechnic University took the subject “Tomorrow’s Leaders” and the lecture on cognitive competence introduced above was well received by students and is considered one of the most welcome lectures in this subject. Students expressed very favorable opinions toward this lecture in various aspects. Students perceived the lecture content as informative and the activities really helped them to understand the concept [42]. Particularly, through experiential learning, they have become more aware of the importance of cognitive competence for university students as “tomorrow’s leaders” and are getting more interested in this topic. Students also perceived the teaching staff as effective in conveying useful knowledge and skills related to cognitive competence to students. Meanwhile, they also realized that cognitive development requires life-long learning and continuous efforts.

As a teacher, the authors have several observations in the class and reflection regarding the teaching experiences. First, a well-designed warm-up activity at the beginning of a lecture is very useful. In this lecture, the warm up successfully raised students’ interests in the topic

and their energy level, which set the tone for the whole lecture. From the beginning, students generally had a favorable attitude toward the lecture and were able to concentrate. Second, interactive teaching approach greatly promotes students' active learning and helps the teacher quickly assess the extent to which students have mastered the knowledge. In this lecture, various interactive teaching techniques were used, such as video watching, group project on problem solving, whole-class discussion, etc. The interactions between teacher and students as well as among students themselves effectively facilitated students' engagement in thinking about the related concepts and theories and applying the knowledge in real problem solving tasks. There were also opportunities to challenge students' understanding of the knowledge and help identify their misconceptions.

Third, students' diverse background and needs must be considered in arranging different teaching activities. As a general education subject, this lecture was delivered to students from different departments with various characteristics. For the same teaching materials, students' ability to comprehend the knowledge and their reflective skills were quite different. For example, students from humanistic disciplines (such as social work, language, physiotherapy, etc.) generally showed higher levels of self-reflective ability and were more expressive than students from science background (e.g., engineering, physics, etc.). Therefore, more time and facilitation shall be given to the latter group of students. Fourth, students' awareness of the importance of cognitive competence has been strengthened in the lecture. Particularly, students were more aware of the role of metacognitive competence in problem solving and decision-making. They realized that cognitive development requires a life-long learning and they were more willing to make efforts to actively develop themselves in this area. Finally, it is important to help students to understand how the concept of cognitive competence is related to their real life experiences.

CONCLUSION

In contemporary society, the society looks for university graduates with a whole range of skills, particularly people who are able to solve problems. To nurture university students who will become the pillar of our society in the future, more effort shall be paid to the development of students' cognitive competence, which includes not only professional knowledge but the ability of problem solving, decision making, and innovative thinking. The lecture on cognitive competence introduced in this paper was well implemented in The Hong Kong Polytechnic University. Students from different disciplines generally had positive perceptions about the lecture and perceived that this lecture effectively aroused their awareness on the importance of cognitive competence and provided good opportunities for them to practice critical thinking and problem solving. This indicates that credit-bearing course that targets at nurturing university students' cognitive development could be quite effective. With regard to the lack of such curriculum-based programs in university settings, this is an important addition to the scientific literature on leadership and positive youth development in the university context.

ACKNOWLEDGMENTS

This work is financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is equally shared by the two authors. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

APPENDIX 1.

Worksheet for class activity: Survival in the wilderness

You and your group mates are on your way to Canada by air in January. Unfortunately, the plane crashed into a mountain near the forest. The crash site is 20 miles away from the nearest downtown. There is snow on the ground, and the countryside is wooded with several creeks crisscrossing the area (溪流的交叉地带). You and your group mates are the only survivors in the crash. Your group managed to salvage the following items:

A ball of steel wool
 A small ax
 A loaded 45-caliber pistol
 A can of tuna
 Newspapers (one per person)
 A cigarette lighter (without fluid)
 Extra shirt and pants for each survivor
 A 20 x 20 ft. piece of heavy-duty canvas
 A sectional air map made of plastic
 One quart of 100-proof whiskey
 A compass
 Several family-size chocolate bars
 (one per person)

Discuss with your group members. Select five items from the above list and rank them from 1 to 5 (1-the most important and 5- the least important).

Your group needs to come to a consensus to pick 5 items from the list for survival.

Items for your survival	Reasons
1.	
2.	
3.	
4.	
5.	

Correct Answer (for teacher's use)

Order	Items
1	Cigarette lighter (without fluid) The gravest danger facing the group is exposure to cold. The greatest need is for a source of warmth and the second greatest need is for signaling devices. This makes building a fire the first order of business. Without matches, something is needed to produce sparks, and even without fluid, a cigarette lighter can do that.
2	A ball of steel wool To make a fire, the survivors need a means of catching the sparks made by the cigarette lighter. This is the best substance for catching a spark and supporting a flame, even if the steel wool is a little wet.
3	Extra shirts and pants for each survivor Besides adding warmth to the body, clothes can also be used for shelter, signaling, bedding, bandages, string (when unraveled) and fuel for the fire.
4	A can of tuna This has many uses. A mirror-like signaling device can be made from the lid. After shining the lid with steel wool, it will reflect sunlight and generate 5 to 7 million candlepower. This is bright enough to be seen beyond the horizon. While this could be limited somewhat by the trees, a member of the group could climb a tree and use the mirrored lid to signal search planes. If they had no other means of signaling than this, they would have a better than 80% chance of being rescued within the first day. The empty can is useful in melting snow for drinking water. It is much safer to drink warmed water than to eat snow, since warm water will help retain body heat. Water is important because dehydration will affect decision-making. The can is also useful as a cup.
5	A 20 x 20 ft. piece of heavy-duty canvas The cold makes shelter necessary, and canvas would protect against wind and snow (canvas is used in making tents). Spread on a frame made of trees, it could be used as a tent or a wind screen. It might also be used as a ground cover to keep the survivors dry. Its shape, when contrasted with the surrounding terrain, makes it a signaling device.
6	A small ax Survivors need a constant supply of wood in order to maintain the fire. The ax could be used for this as well as for clearing a sheltered campsite, cutting tree branches for ground insulation, and constructing a frame for the canvas tent.
7	Several family-size chocolate bars (one per person) Chocolate will provide some food energy. Since it contains mostly carbohydrates, it supplies the energy without making digestive demands on the body.
8	Newspapers (one per person) These are useful in starting a fire. They can also be used as insulation under clothing when rolled up and placed around a person's arms and legs. A newspaper can also be used as a verbal signaling device when rolled up in a megaphone-shape. It could also provide reading material for recreation.
9	A loaded .45-caliber pistol The pistol provides a sound-signaling device. The international distress signal is 3 shots fired in rapid succession. There have been numerous cases of survivors going undetected because they were too weak to make a loud enough noise to attract attention. The butt of the pistol could be used as a hammer, and the powder from the shells will assist in fire building. By placing a small bit of cloth in a cartridge emptied of its bullet, one can start a fire by firing the gun at dry wood on the ground. The pistol also has some serious disadvantages. Anger, frustration, impatience, irritability, and lapses of rationality may increase as the group awaits rescue. The availability of a lethal weapon is a danger to the group under these conditions. Although a pistol could be used in hunting, it would take an expert marksman to kill an animal with it. Then the animal would have to be transported to the crash site, which could prove difficult to impossible depending on its size.

Order	Items
10	One Quart of 100 proof whiskey The only uses of whiskey are as an aid in fire building and as a fuel for a torch (made by soaking a piece of clothing in the whiskey and attaching it to a tree branch). The empty bottle could be used for storing water. The danger of whiskey is that someone might drink it, thinking it would bring warmth. Alcohol takes on the temperature it is exposed to, and a drink of minus 30 degrees whiskey would freeze a person's esophagus and stomach. Alcohol also dilates the blood vessels in the skin, resulting in chilled blood being carried back to the heart, resulting in a rapid loss of body heat. Thus, a drunk person is more likely to get hypothermia than a sober person is.
11	A compass Because a compass might encourage someone to try to walk to the nearest town, it is a dangerous item. Its only redeeming feature is that it could be used as a reflector of sunlight (due to its glass top).
12	A sectional air map made of plastic This is also among the least desirable of the items because it will encourage individuals to try to walk to the nearest town. Its only useful feature is as a ground cover to keep someone dry.

ABSTRACT

In many adolescent developmental models, it is proposed that having a clear and positive identity is an important developmental task for adolescents. In this chapter, the conception of positive and healthy identity and the related theories are outlined and the determinants and effects of having a positive and healthy identity are presented. The relationship between healthy and positive identity and leadership is then explored. Finally, the question to know how positive and healthy identity can be promoted is examined. Issues surrounding the ways of how to teach students to develop the attribute of having a clear and positive identity as a leader are discussed.

INTRODUCTION

For many decades, many studies have explored the nature and development of identity across different disciplines. In different theories, personal identity has been regarded as an

* Corresponding Author's Email: aniel.shek@polyu.edu.hk.

essential concept to understand the development of oneself [1-4]. According to Sharma and Sharma [5], identity “is an umbrella term used throughout the social sciences to describe an individual’s comprehension of him or herself as a discrete, separate entity” [5]. Identity formation is a dynamic and evolving developmental process that could be structured meaningfully into the general, physical, psychological, social and spiritual domains [4]. In the Western societies, there has been a strong urge for individuals to search for their own unique identity by understanding their own characteristics and choosing from a large variety of socially-formulated alternatives [6]. Although the identity for the traditional Chinese was quite “static” and closely related to the class or hierarchy in which they were born, the quest for identity is still an essential issue for the Chinese in searching for “Who am I” and “Who I really am?” [4].

Within the field of psychology, the notion of “identity” is closely related to the concept of “self”, with examples of related concepts like “self-concept” and “self-identity” which are closely related to the belief that personal development is a process of acquiring and achieving different “selves.” Generally speaking, the formation of identity is by individual’s collection of self-understanding, self-conceptions and self-images [6, 7]. The “self” plays a crucial role in defining and formulating one’s own identity. Through the dynamic process of comprehending different concepts about self, an “identity” is evolved and an individual might have a better understanding of how his or her past and present experiences help formulate the identity as he or she understands now. This is an active and creative process of making sense of the personal experiences to formulate one’s own identity, which increases the awareness of “self” to help one recognize and examine one’s identity.

During the process of making sense of one’s experiences and his or her idea of “self”, the understanding of different “selves”, including “real self”, “ideal self” and “ought self” assists an individual to identify whether an individual has achieved his or her identity. “Real self” is the self as the individual *experiences*; “ideal self” is the self that the individual *wishes or desires* to be; and “ought self” is the self that an individual *should* be. The development of a person could be seen as a process of acquiring and achieving these different selves. The extent to which these three selves overlap determines whether a person’s identity is well defined or not [1]. However, some scholars reiterated that the functions of self-knowledge focus only on the factual idea of “self” at present which might limit a person’s understanding on how their own expectations and the social reality influence their process of identity formation [3]. The self-knowledge should be extended to exploring the “possible selves,” which is the understanding of how an individual think about their potential and future. Although the possible selves share similarities with the “ideal self” such as representing what an individual would like to be in the future, it also explores the self that we could become and fear to become. The possible selves are more individualized and personalized with the comprehension of the hopes, dreams and fears of the past-, present- and future- selves [3, 8].

Apart from looking inwardly at one’s own identity formation and the possible selves, the perceptions of others, social contexts and the environment also contribute to one’s identity formation [9]. Traditionally, “identity” was believed to be a fairly uniform concept but with massive structure comprising some number of physical features and psychological structures [3]. A review of the recent literature showed that identity is now portrayed as an “ever-changing” process through which an individual can formulate his or her identity by understanding his or her own perceptions of self, the experiences throughout the life span and others’ perceptions and views on the individual [3, 7]. The construction of “self” is seen as a

result of comparisons in which the individual's own thoughts, feelings, characteristics and behaviors are compared with those of others. The reflections from and the understanding of other people or the generalized community might also help give another perspective to individuals to formulate their own identity.

Regarding the discussion of identity, Erik Erikson's theory is the most prominent theory addressing the nature and the development of adolescent identity. He proposed the eight-stage human development framework with a particular emphasis on the identity formation in the stage of adolescence [6]. Erikson [1] conceptualized the ego identity both as "conscious" comprehension of one's uniqueness and "unconscious" striving of one's experiences. An "identity crisis" might occur when adolescents seriously start questioning their "conscious" and "unconscious" selves, the perceptions of themselves, and how others view them. "Identity crisis" represents a psychosocial task and constitutes a challenging turning point for adolescents to achieve a healthy adult identity. The adolescents might move toward either "identity achievement" or "identity confusion" statuses [1].

Marcia's [2] identity status paradigm is the most popular elaboration of Erikson's views on identity formation [4, 6]. Marcia [2] identified two important elements (i.e., exploration and commitment). "Exploration" refers to the active questioning and inquiring of different roles, values, beliefs or goals to offer an individual various identity alternatives. "Commitment" refers to the firm choice made regarding aspects such as vocation, political ideology, religion and social roles, and the strategies geared toward those desired paths and outcomes. Four identity statuses are derived from the interaction between exploration and commitment, which are "identity diffusion," "moratorium," "foreclosure," and "identity achievement." In identity diffusion, there is no pro-active interaction between the exploration and commitment and no commitment has been made for any identity domain. Moratorium refers to an individual who has explored actively various identity alternatives yet with no commitment to them while foreclosure denotes the status that commitment has been made with little exploration. For identity achievement, an individual actively explore different identity alternatives thoroughly and make a commitment to the choice in a specific identity domain.

In recent decades, the focus of investigating the identity statuses has shifted from focusing exclusively on the outcomes to focusing on the process of identity formation and development. As the author of the four identity statuses, Marcia [10] recognized the importance of exploring the process of identity formation rather than the outcomes. Building upon Marcia's work on the identity statuses, recent research has explored the newly developed identity models like "commitment," "in-depth exploration" and "reconsideration of the commitment" [6]. "Commitment" denotes similar view as Marcia's model yet the individual's self-confidence in committing to the choices is elicited in the process more explicitly. For "in-depth exploration," the individual would reflect upon the choices made, explore additional information about the choices an individual is making or going to make, and discuss with significant others about the choices and the reflections. "Reconsideration of the commitment" refers to an individual's re-consideration of the present alternatives and strives for the best commitment as the present one is no longer satisfactory. The newly developed orientation in exploring the process of identity formation sheds light on enriching the exploration and investigation of identity development.

It is our belief that before one leads others, one must have a clear and positive identity. Before exerting influence on others as a leader, it is essential for an individual to search and

discover “who he or she is,” what they value and for them to build a clear understanding of “self.” In the leadership process, clear understanding of self and the identity, known as the “authentic leadership,” provides a firm anchor for decisions and actions and offers positive modelling to the development of followers’ self-awareness of their values, identity, emotions and motives [11]. This clear self-understanding and sense of identity is achieved through the unbiased collection and interpretation of self-related information of the leader without distortion and exaggeration. The heightened levels of self-awareness of a leader help him or her be more engaged with their role as a leader and develop a distinct “leader identity”. The individual with this distinctive leader identity would become the “prototypical member” [11] who views himself or herself as the role model who could be trusted and respected and exerts influence, and hence leadership, on the rest of the group.

The self-understanding of an individual does not only consist in contributing to its own individual well-being but also to the organizational or collective good. The clear identification of the leader and follower not only serve as distinguishing social relationships, but it also helps build social identities as individuals would define themselves as being members of the organization or the community. The collective identification implies the “psychological merging” of self and the group that the individuals identify themselves with as they see themselves as similar to members of the group [12]. When the definition of “self” is extended to the collective terms, collective interest becomes self-interest and the individuals would be motivated to contribute to the collective good and move towards the collective goals of the community or the organization. In their studies, Kark, Shamir and Chen [13] found that the social identification has mediated the positive relationship between transformational leadership and aspects of self-concept such as self-efficacy, collective efficacy and organization-based self-esteem.

Lecture Content

The development of a clear and positive identity involves “building self-worth and self-esteem, facilitating exploration of and commitment to self-definition, reducing self-discrepancies, and further fostering role formation and achievement” [4]. Successful leaders not only have a clear and positive identity, but they also motivate followers to search for their own identities [12]. In this lecture, the concepts of self and identity are discussed. Strategies for facilitating the development of self-conception (i.e., self-concept, self-identity) are also presented.

As far as the intended learning outcomes are concerned, it is expected that the students should be able to master the following concepts and skills after the completion of this lecture: a) understand the basic concepts and theories related to positive identity and related concepts; b) articulate the antecedents and consequences of having positive and healthy identity; c) discuss the role of positive and healthy identity in leadership; and d) explore ways to promote the development of positive and healthy identity. The teaching methods in this subject include lecture, group discussion, in-class interactive activities (such as drawings), and self-reflection.

There are five parts in this lecture. In Part 1, the basic concepts and theories of self-identity are outlined. In this part, a warm-up activity (“How do I view myself?”), class discussion on “Living Funeral” and a self-reflection exercise (“Can I (You) see the REAL

ME?") are involved. In Part 2, the antecedents and consequences of self-identity and self-concept are introduced. A class activity entitled "The Image of a Successful Leader" is conducted. In Part 3, theories and research findings on the relationship between positive identity and leadership are presented. In Part 4, ways to promote positive and healthy identity are discussed. In particular, teachers will share their experience in this area. In Part 5, conclusion and reflections are carried out. A self-reflection exercise on "A Memorandum to Myself" will be introduced.

In Part 1, the lecture commences with a warm-up activity named "How do I view myself" with the purpose of helping students reflect on how well they describe themselves. "Identity" is well understood as "an umbrella term" [5] and adolescents might find it difficult to conceptualize their own identities without concrete vivid aids. When the question "who am I" is asked, it is difficult for an individual to formulate concretely who he or she is throughout the life process. With the aid of the images of animals projected on screen and printed on a worksheet for easy reference, students are asked to choose an animal (or they could propose other animals not on the list) which could best represent themselves in different contexts (e.g., when they are studying or when they are with friends/family members). This might help the university students visualize their self-images through familiar animals or objects. After choosing the image of an animal, students are encouraged to share their choices in pairs or within their own groups in order to have a preliminary understanding yet multi-angled conception of their own identities. This warm-up activity is wrapped up by stating the rationales of the activity, which can facilitate the students' exploration of self-definition and understand how these self-definitions might influence the identity formation in their lives [4].

After the warm-up exercise, a model of self-concept and a theory of identity statuses are introduced to help students address the core questions when exploring the development of identity. The introduction of "the hierarchical model of self-concept" advocated by Shavelson, Hubner and Stanton [14] aids students to explore and understand the development of self-concepts in different domains in respect of academic, social, emotional and physical domains. Through evaluating self-perception of experiences in different domains, the students could gain some basic understanding of "self-concept" in each area and as a result could better understand the overall concept of self. Teachers conclude these domain-specific evaluations by asking students to examine how these evaluations influence their overall self-worth and the perceptions of themselves in relation to their environment. Marcia's [2] theory of "four identity statuses" (i.e., identity diffusion, foreclosure, moratorium and identity achievement) is presented afterwards to enhance students' understanding of the structure and dynamics of identity development. Examples in daily life are given against each status to assist students in understanding the interactions of "exploration" and "commitment." An example of "Your religious commitment," drawn from Marcia's [2] article is given to illustrate the typical answers on the four statuses and help students understand how these statuses influence one's decision-making and identity-formation. This part is concluded by articulating the essence of identity-formation, which refers to the integration of different roles into an identity that helps one to answer the question "Who am I" more thoroughly.

In order to have a more in-depth exploration of self-identity, the antecedents and consequences of self-identity and self-concept are illustrated in Part 2. This part starts off with a self-reflection exercise and a group sharing on an excerpt "living funeral" of a book "Tuesdays with Morrie" [15]. This excerpt is about Professor Morrie, who suffered from the Amyotrophic lateral sclerosis (ALS) and his life was going to end soon, so he prepared a

“living funeral” to hear about the words and comments of his loved ones on himself. This extracted piece is arranged to help students reflect on how one’s own and others’ (especially the significant others) perceptions and past experiences influence one’s identity development. The self-reflection is further deepened by the “Can I (You) see the real me?” exercise. The purpose of this worksheet is to help students better understand their different selves by articulating the three most important actual (“actual self”) and ideal (“ideal self”) attributes that the students and their parents or good friends perceive them to have. The students are invited to think about the reasons for the discrepancies between the “actual self” and the “ideal self” and further reflect on how these discrepancies influence their own identity formation.

By specifying the perceptions of the “actual self” and the “ideal self,” the students could grasp the preliminary ideas of the factors affecting the development of their identities. Then the factors influencing the identity formation derived from the literature are introduced to students. The factors are introduced at both levels – the individual level (e.g., visible physical disabilities; body image dissatisfaction and gender) and the social level (e.g., peer relationship; family and socio-cultural norm), which echo the “dynamic” nature of identities of Marcia’s model introduced in Part 1. The consequences (self-monitoring; psychological well-being and academic adjustment) are also presented in this session to help students understand the importance of having a positive and healthy identity. The students’ understanding of the concept of identity is further reinforced by inviting the students to draw an image of a successful leader. A list of successful leader’s attributes is distributed to students. The students discuss among their groups and choose the three most important attributes (or more) that might contribute to the success of a leader. Then the students are asked to draw the image on a poster-size paper and are invited to share the reasons for choosing these attributes. This activity helps students to recognize and visualize the attributes that might help them develop their ideal leadership attributes and have a concrete image of a successful leader. This might help make the students aware of the potentials they possess and understand the “possible selves” that they might wish to achieve.

In Part 3, the focus is put on the relationship between positive identity and leadership. In the traditional approach to leadership, leadership is viewed as transactional: the leaders would set a task goal with rewards and ask the followers to work towards completing the task in exchange of rewards. The leadership is exerted through the exchange relationship between the leader and the follower. However, transformational leadership has been advocated in recent decades as the leader is treated as a changing agent empowering the followers to understand their own self-conceptions, identities and potentials. This constitutes a relationship of mutual stimulation and elevates the followers to be leaders [11]. With the introduction of the differences between transactional and transformational leadership, students can understand that the types of leadership depend on how you define the identity of a leader.

The ways to promote positive and healthy identity are introduced in Part 4 as a summary session for summarizing the ideas about identity formation discussed in the previous parts. Five ways of promoting positive and healthy identity are depicted to show students how to consolidate the key learning points in the previous parts. Firstly, the “self-evaluation” is intended to guide us to re-think about the standards we are using to evaluate ourselves. This evaluation is not depicting one’s weaknesses but aims to help people lead a purpose-driven life instead. Secondly, it is important to cultivate one’s self-efficacy (i.e., our ability to perform and achieve a goal). Focusing on what an individual is able to do can help him or her

to be persistent in his or her goal-directed behaviors and help them succeed in pursuing these goals.

To have self-acceptance is the third way to construct one's identity. It is thought that self-acceptance is a crucial step to cultivate a positive and healthy identity by overcoming the "trigger events" and to assist an individual in shaping his or her identity development [11]. "Authentic living" and "positive thinking" are the last two ways to be introduced. Students are encouraged to behave and express their emotions and views according to their true selves, which is to live authentically, and to think positively to accentuate their strengths. The teachers' sharing is strongly encouraged in this part to act as an example for students to understand how to develop a positive and healthy identity in a real life situation. The teachers' self-disclosure is one of the crucial teaching pedagogies in the subject "Tomorrow's Leaders." It is believed that a self-disclosing atmosphere inside the classroom could act a catalyst to facilitate students' sharing and personal reflection and thus encourage the openness of students [16]. In addition, through sharing the success or failure of building a positive and healthy identity by teachers, students could integrate the theories learnt in the previous parts with their own personal reflections or experiences. Learning is thus enhanced through the interpersonal dynamics between teachers and students.

The lecture ends with a self-reflection exercise consisting in writing "A memorandum to myself." The students are asked to evaluate the "now-me" in relation to the three most salient positive and negative characteristics that they perceive about themselves. The students are then invited to foresee the three most salient characteristics in their self-image when they graduate and think of the ways to build up these characteristics in their self-concept. The students are strongly advised to keep this memorandum until they graduate so that they can witness their own personal growth. Finally, a few reflective questions (for example, "How does the Chinese culture shape your self-concept?"; "How does your family influence your self-concept?") are raised to help students consolidate what they have learnt in the lecture and widen and deepen the horizons of students' reflections on identity-formation.

There are several issues that a teacher should be aware of when teaching the topic on positive and healthy self-identity. First, Chinese adolescents in Hong Kong are not encouraged to reflect on their self-identity in the socialization process. Actually, adolescent children are encouraged to develop a "foreclosure" identity such as getting good academic results and studying in a program with "good career prospect." Therefore, it is a frightening and challenging experience for Chinese adolescents to face their "real" self instead of their "ought" self. Second, there are two tendencies generally followed by Chinese people when describing themselves openly. On the one hand, they may respond in a "socially desirable" manner by not disclosing one's weaknesses. On the other hand, with the emphasis on humility and interpersonal harmony, Chinese people tend to describe themselves in a reserved manner. Hence, teachers should be alert to these Chinese characteristics in self-description. Third, within a collectivistic culture, as Chinese people tend to focus more on the "ought" self (i.e., what other people want you to be) instead of the "ideal" self (i.e., what one wants oneself to be), more coaching and directions are needed.

ACKNOWLEDGMENTS

This work and the course on ‘Tomorrow’s Leaders’ are financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is equally shared by the two authors. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

ABSTRACT

Resilience is an important construct in the positive youth development literature. In this chapter, the definition and concept of resilience are introduced. The relationships between resilience and adolescent development as well as leadership are also addressed. To help students develop qualities on resilience, a lecture on resilience is developed in a subject entitled "Tomorrow's Leaders." The objectives, intended learning outcomes, lecture outline, and lecture materials are presented in this chapter. Some issues surrounding the teaching of this lecture are discussed.

INTRODUCTION

Adolescents are confronted with multitude of challenges, resulting from developmental changes, as well as threats present in their external environment, such as problems with interpersonal relationships, conflicts with parents, close friends, and romantic partners [1], emerging identity confusions [2], and heightened competitiveness in the job market [3]. While some adolescents are able to successfully weather through these storms, others may engage in health-compromising behaviors to drown their worries. Researchers recognize the need to investigate factors critical for increasing the likelihood of adolescents to remain on healthy and productive trajectories to adulthood, in spite of the ebb and flow in life. Resilience has been identified as a buffering factor against the adverse impact of oscillations, enabling positive outcomes.

Although university students are generally perceived to be a privileged group of adolescents, this does not imply that they are immune to stress and mental disorders [4]. Studies found that university students suffered from psychological problems including personality disorders and depression [5]. Some students even reported that they felt so depressed it was difficult to function [6]. Increasing trends in problem behaviors, such as illicit drug use, alcohol abuse, and self-injury were also noted in this population [7]. With the heightening prevalence of mental disorders and developmental problem behaviors among adolescents worldwide, researchers and practitioners begin to question why certain adolescents when confronted with life's hardships, snap; while others are able to snap back? [8]. "Resilience" is one of the answers.

Concept of Resilience

Various metaphors for resilience have been elicited by researchers to elucidate the concept:

"Resilient leaders are like rubber bands; they bounce back from adversities stronger and faster, learn from experiences, gain more self-confidence in the process and develop new skills." [9]

"A cast iron is hard, brittle, and breaks easily (not resilient), whereas wrought iron is soft, malleable, and bends without breaking (resilient). This metaphor can be carried over to psychological resilience, which entails a similar resistance to the psychological strain associated with negative experiences." [10]

According to Greene and Conrad [11], resilience refers to an individual's capacity to cope successfully when confronted with changes, risks, and adversities. Effective coping involves the ability to bounce back from adversities [10], to operate above the norm in spite of stress [12], and to move forward from a catastrophe with greater vigor and experience a positive change [13]. It has also been conceptualized as a buffer mechanism that helps ameliorate a person's reaction to an adverse situation that in ordinary circumstances may negatively impact on one's life [14]. Pulley [15] outlined several characteristics of resilient individuals, including engagement in life-long learning, having high-levels of self-efficacy, possession of a sense of meaning, engagement in continuous improvisation, are less occupied with monetary attainment and definition of identity and success by their internal values and standards.

Traditionally, resilience has been conceptualized as a trait-like construct, implying a fixed or an all-or-none nature [16]. Empirical evidence has since demonstrated that there are methods through which resilience can be enhanced. Tugade and Fredrickson [10] showed that individuals can make use of positive emotions to build resilience. High-resilient individuals are able to experience positive emotions even amidst stress. Survivors of the 911 terrorist attack reported experiencing negative affects including fear and anger, but also that of positive emotions, such as gratitude and love, which helped them get through the traumatic event [17]. Fostering self-enhancement has shown to be effective in strengthening resilience [18]. The effectiveness of the above measures in building resilience suggest on its malleable nature.

Resilience and Adolescent Development

In contrast to risk factors, different categories of protective factors have also been identified to positively impact on one's resilience. These include individual factors (e.g., healthy attribution style, hope) or dispositional attributes (e.g., emotional stability, openness, agreeableness) [19, 20], relational factors (e.g., social support, supportive family environment), and community factors (e.g., good school, community assets). It has been speculated that one of the reasons for the occurrences of mental health issues and problem behaviors in adolescents is their lack of resilience -their inability to apply productive strategies to cope with stress [21] and their incapability to effectively deploy their emotional, cognitive, and social resources in troubling times [22-24]. Low levels of resilience have been associated with an array of developmental problems, including alcohol use [25], school failure, adolescent pregnancy, and delinquency [26]. On the other hand, adolescents who possess high levels of resilience are able to develop healthily in different areas. Resilience has been associated with lower levels of academic stress [27], higher levels of self-esteem, and effective use of problem-solving coping strategies when facing difficulties [28].

Resilience and Leadership

Resilient leaders are equipped with psychosocial and behavioral competencies that enable them to bounce back from inevitable setbacks and failures. On an intrapersonal level, resilient leaders often have high levels of emotional stability [29]. Emotional intelligence facilitates individuals' adaptation to change, through receptivity (i.e., one's willingness to consider change), mobilization (i.e., concrete steps individuals take in times of change), and active learning from the outcome of changes [30]. Cognitive abilities to perceive experiences positively and tolerate uncertainty [31] have also been associated with information seeking, making sense of, and ascribing meaning to changes and risks, which are critical for resilience. On an interpersonal level, followers observe resilience from their leaders which operates on a "cascade and contagion" mechanism; the witness of resilient leaders' success enables followers to build on such efficacy and develop their own resiliency to recover from subsequent setbacks [32] and to provide intellectual stimulation for followers [33].

Resilience in leadership literature is often considered as a construct under the umbrella of positive organizational behaviors and a type of psychological capital (PsyCap). PsyCap is defined as “an individual’s positive state of development” [34] marked by individuals’ (i) self-efficacy (i.e., being confident that one is able to take on challenges and achieve organizational goals), (ii) optimism (i.e., making positive attributions about succeeding in the present, as well as the future), (iii) hope (i.e., persevering in challenging times and redirecting paths when necessary), and (iv) resilience (i.e., bouncing back and performing beyond norms to attain success). Resilience in this context is conceptualized as a reactive process, where the presence of risk factors activates the resiliency process. Although PsyCap was initially developed in the organizational arena from the West, Luthans et al. [35] emphasize the imperative need to develop and manage “this untapped positivity” in Chinese societies. Riolli and colleagues [14] also suggested its applicability to the academic setting by arguing that students experience many difficulties which are common to those found within a business setting. This is supported by their findings which demonstrate that students’ PsyCap levels were positively correlated to their psychological well-being, life satisfaction, and health symptoms.

PsyCap also acted as a buffer against the impact of stress on negative outcomes. Riolli and colleagues [14] believed that it was likely that students with higher levels of PsyCap make use of optimistic explanatory styles when perturbed. The findings from their study yield “implications for university educators to include a focus on aspects of psychological capital within the academic curriculum. Psychological capital may be as, or even more, valuable as a resource for students than is traditional academic content, since PsyCap helps students persevere in their studies in a psychologically and physically healthier manner” [14]. Stoltz [36] asserted that “resilient individuals, teams, and organizations consistently outlast, outmaneuver, and outperform their less resilient competitors - making resilience training one of the most important emerging trends in learning” [36]. King and Rothstein [37] concur that “while exceptional leaders are considered to be highly resilient, resilience is not a characteristic of exceptional people,” which implies that resilience is an attribute that can potentially be learned.

Identity status change during adolescence and young adulthood: a meta- nurtured in all students. The above converge to bring forth the need to develop a curriculum that will incorporate the skills for enhancing resilience among university students. In fact, resilience is not merely a competency; it is also an attitude, “a reflex, a way of facing and understanding the world, that is deeply etched into a person’s mind and soul” [8], a life-long attitude that we aim to nurture in leaders of tomorrow.

Lecture on Resilience in “Tomorrow’s Leaders”

Riolli and colleagues [14] claimed that “the impact of those stressors on student well-being can have a variety of negative psychological, health, and behavioral effects that may reduce student effectiveness, cause high levels of distress, and in the long run deprive the economy and the nation of valuable, educated contributors” [14]. Given the far-reaching impact of resilience on individual and societal development, researchers argued for the need to develop campus-wide programs to build resilience factors in the student population [25].

However, the majority of the existing positive youth development interventions aimed at promoting holistic development (including resilience) in adolescents have been developed and investigated in a Western context. Few programs have been comprehensively and systematically implemented in an Asian context (with the exception of Project P.A.T.H.S. in Hong Kong) [38]. There are arguments that a curricular-based approach adopting the positive youth development model [39], that includes resilience and other protective factors, would be helpful to nurture university students. In addition, culture specific factors influencing the development of resilience have also been identified and must be considered in preventive programs. Therefore, the teaching aims of the present lecture on resilience are to introduce the basic theories and concepts related to resilience, highlight its importance to adolescent development, and outline the protective factors that contribute to the development of resilience, and encourage students to make use of these factors and resources when encountering setbacks.

The lecture on resilience introduces the concepts and theories of resilience and highlights the importance of resilience in effective leadership. Practical skills and strategies for strengthening one's resilience are also presented. Regarding the intended learning outcomes, it is expected that students should be able to: a) define the basic concepts and theories related to resilience; b) identify the antecedents and consequences of resilience; c) recognize the relationship between resilience and leadership; d) list a variety of ways to promote resilience; and e) critically discuss issues related to resilience. The teaching methods include lecturing, video playing, experiential learning activities, group discussions, and self-reflection.

As far as the lecture organization is concerned, there are four parts of the lecture. In Part 1, the definitions and theories of resilience are presented via three activities: warm-up activity ("Armless piano performance by Liu Wei"), experiential learning activity ("mission possible") and self-reflection activity ("are you resilient?"). In Part 2, the relationship between resilience and leadership is addressed and the video clip on "the stories of Steve Jobs" is shown. In Part 3, ways to promote resilience are discussed. The lecture ends by showing a video clip of "Nick Vujicic." In different parts of the lecture, students are challenged to critically discuss and share their ideas on controversial issues related to resilience.

The lecture begins with a video clip aimed at introducing the concept of resilience. A touching piano performance by an armless pianist, Liu Wei, on a China music talent show is played. Twenty-six years-old Liu Wei had both his arms amputated at the age of 10 years shares in the video, the hardships he has undergone and how he is able to overcome adversities and persist to achieve his dreams of being a pianist. Students are then invited to share their thoughts and feelings after watching the clip. Many students admired Liu's will to live a fruitful life in spite of his circumstances. The lecturer then concludes by highlighting the importance of perseverance in overturning adverse situations in life.

The purpose of the first part of the lecture is to introduce the concept of resilience. First, various definitions of resilience will be given and the core essence of the concept will be highlighted. Second, components of resilience will be outlined; specifically, the different intrapersonal and interpersonal factors (e.g., dispositional attributes, familial factors, social support systems) that have impacts on the development of resilience will be discussed. Third, the importance of resilience on positive development will be illustrated with the use of research showing the positive impacts of high resilience and adverse effects of lacking thereof. Students are guided to consider about the nature-nurture debate pertaining to

resilience, i.e., whether they believe that resilience is a malleable asset and to perpend on factors influencing individuals' resilience.

Subsequent to the lecturing section, the first experiential learning activity will be conducted. The activity entitled "mission possible" aims to provide students with a first-hand experience, both physically and emotionally, how it feels to be confronted with an obstacle, given limitations. The activity stresses the importance of creativity, determination, and social support in overcoming challenges. The activity is divided into two stages. In the first stage, students are asked to work alone to complete the task. Without using their palms, they are to creatively devise methods in which they could effectively copy a quote, as well as a simple picture (shown to them on the PowerPoint) to a piece of paper, within an assigned timeframe. Some interesting methods students came up with include using their mouths, wrists, or attaching pens to their watches to complete the challenge. In the second stage of the activity, students are asked to work collaboratively with their group mates. A pile of small candies are distributed evenly on a table, similar to stage one, without using their palms, students are instructed to think of ways in which they could work together to pick up as many candies as possible. Students often made use of their arms, or other tools such as their jackets to facilitate the process. Upon completion of the two stages, students are invited to share how they felt during the two challenges, how the two stages differ from each other, and reflect on how the activities are related to resilience. Students frequently reported feeling frustrated in the beginning, but a sense of efficacy upon devising creative methods to solve the task. They also realized the importance of social support and collaboration, making the second stage easier than the first to complete. Students are then invited to critically discuss how social factors (e.g., family, peers, community, etc.) may influence individual's levels of resilience. Students are steered to consider the development of resilience as an ongoing process across one's lifespan and how external factors can impact the process. Teachers conclude this activity by relating back to the theories of resilience, reiterating the essence of the concept and stressing the components and factors that contribute to resilience.

Following the activity, a self-reflection activity entitled "are you resilient?" will be conducted where students complete the 10-item Resilience Assessment Questionnaire [40] aimed at providing them with a better understanding of their degree of resilience, and increasing their awareness of areas in which they can work on to increase their resilience. Students indicate on a 5-point Likert scale the extent to which they agree, ranging from 1 (strongly disagree) to 5 (strongly agree), to statements such as, "I view change as an opportunity." and "I regularly participate with friends in social activities where I can relax." Students are asked to reflect on their strengths and weaknesses with relevance to resilience. Teachers also share the scores they obtained from the Resilience Assessment Questionnaires and areas in which they need improvements on. Following the sharing of the results, teachers also share personal stories of hardships experienced in the past, and how resilience has helped them overcome the obstacles.

In the second part of the lecture, the relationship between resilience and leadership is emphasized. In small groups, students are first asked to brainstorm and make a list of attributes that they think resilient leaders should possess and share their ideas with the class. Teachers then highlight the fact that being a resilient leader requires a diverse set of psychosocial competencies. Research findings on qualities (e.g., emotional stability, strategic problem solving skills in times of stress, intellectual stimulation) inherent to resilient leaders are shared. The concept of psychological capital and its relevance to resilient leadership will

also be introduced. Subsequently, teachers will ask students whether they think that Steve Jobs is an effective leader and reveal that in fact, Jobs also faced numerous obstacles on his path to success. Students are shown a video clip of the commencement speech that Jobs delivered to university students at the Stanford University in 2005 [41]. In his speech, he shared three stories from his life. First, the hardships he faced growing up as an adoptee and the challenges he encountered during his quest for a meaning of life as a college student. Second, the journey of finding what he was passionate about in life and his career, as well as the obstacles he encountered when setting up his first company. Third, Jobs talked about his diagnosis of cancer, how he recovered from it, and his realizations as a result of this adversity.

After hearing Jobs' commencement speech, students are invited to choose one of the three resilient stories that was most inspiring to them and reasons for supporting their choice. Students choose different stories for various reasons. Some felt that they can relate to the first story most; being a university student faced with increasing demands and expectations posed on them. They were trying to adapt to their role as a university student while simultaneously searching for their identities and reasons for choosing their majors. Some students felt that the second story was most inspiring; it related to finding what one is passionate about and how this love enables perseverance in times of tribulations. Students shared how they experienced failure from obtaining poor results in their public examination, but their ambition to enter university to pursue their ultimate career goals reminded them not to give up and to work even harder toward their dreams despite the setback. Lastly, some students shared stories of experiencing death of family members, close friends, or personal illnesses and how they overcame the period of hardship and what they have realized about the meaning of life. Teachers thanked students for their sharing and concluded this section by highlighting that adversities are inevitable in different stages and domains in one's life, and even successful leaders experience obstacles. However, the outcomes of these misfortunes are determined by whether individuals are resilient and able to turn these challenges into opportunities and how determination, perseverance, passion for what you do, and love for those around you help transcend suffering in turbulent times.

In the third section of the lecture, practical methods in which students can strengthen their resilience is introduced. According to the American Psychological Association [42] ten ways to build resilience include: (i) maintain positive relationships with family members and friends, students are reminded that in times of adversity, they need not feel shy to seek help from family and friends and that social support is an effective way that can help one get through tough times. Providing help and being a good listener to others' problems can also help strengthen one's own resilience; (ii) avoid perceiving stressful events as insurmountable problems, highlighting individuals' free-will and active role in interpreting inevitable events; (iii) accept circumstances that cannot be changed by accurately assessing the attainability of goals against the changing environment and making alterations when called for; (iv) develop realistic goals and work towards them; (v) take decisive actions in adverse situations rather than engaging in avoidance coping; (vi) develop self-confidence; (vii) search for opportunities of self-discovery after struggles and losses; (viii) keep a long-term perspective and consider stressors in a broader context; (ix) maintain a hopeful outlook and visualize what you want or desire; and (x) take good care of one's mind and body by exercising regularly and maintaining a balanced life.

As one of the intended learning outcomes of this lecture is for students to critically discuss issues related to resilience, students are further challenged to contemplate on and discuss controversial topics pertaining to resilience. These include, (i) Whether resilience is merely an active coping process as conceptualized by Western theories and models or whether passive coping strategies are also effective in overcoming adversities? Particularly, students are invited to consider (ii) How cultural beliefs impact on resilience; e.g., traditional Confucius teachings suggest that sufferings should be accepted as an inevitable part of human life, and (iii) teachers introduce the Chinese proverb “Hardship increases stature” which underscores the functional value of failures and adversities to human development and maturity. Based on the above ideologies, students are invited to comment and discuss their views and to reflect on their personal beliefs of resilience based on one’s own cultural values.

To conclude the lecture, a final video clip of Nick Vujicic is shown to students as a wrap-up of the lecture and to encourage them to be resilient. A brief biography of Vujicic, who suffers from a rare disorder characterized by the absence of all four limbs, is outlined in the video. Photographs and videos of how he accepted his circumstances and overcame his disability and strived to live a fruitful life are presented. Segments of Vujicic’s motivational speeches addressed to high school students are also shown.

Teachers finish off by reminding students that with faith and determination, everyone can be a resilient leader.

To what extent is the subject “Tomorrow’s Leaders” able to promote positive development in the students? In a series of evaluation studies using different methods (including objective outcome evaluation, subjective outcome evaluation, and process evaluation), findings showed that the subject is able to promote the psychosocial competencies in students [43-48].

For this lecture, post-lecture evaluation with the collection of quantitative and qualitative evaluation data reported previously demonstrated that students appreciated the lecture and felt that the lecture was able to promote their resilience.

“I really like today’s lecture. Thanks for giving us so many videos to watch and they are very meaningful, touching, and inspiring... In today’s lecture, I learnt that ... resilience is not only the most important attribute in becoming a leader but also for own life’s attitude.”

“I learnt how to be resilient and make a sense that ‘nothing is impossible.’”

“I think though I may not need some of them (the theories or skills introduced in the lectures) now, sooner, like Steve Jobs once said, ‘The dots will somehow connect in your future.’”

“Even if we fail or we’re frustrated, we can still prove our values, our uniqueness by fighting back fiercely. The rainbow exists where the storm ends.”

Resilience is considered as a multidimensional construct that includes intrapersonal attributes (e.g., self-concepts, emotional competence, problem-solving skills, and spirituality), interpersonal competencies, and external protective factors (e.g., supportive family and social environment). This lecture provides students with theories, underpinnings, and importance of resilience and presents a comprehensive view of how different attributes (i.e., topics in the curriculum) contribute to individuals’ development of resilience as effective leaders.

ACKNOWLEDGMENTS

This work and the course on ‘Tomorrow’s Leaders’ are financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is equally shared by the two authors. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

ABSTRACT

To lead others, successful leaders must first be able to lead themselves. Hence, self-leadership is an important element of leadership development for university students. In this chapter, the definitions of self-leadership and responsibility are introduced. Their impacts on effective leadership are also addressed. In addition, the concept of egocentrism as a barrier to effective leadership and adolescent development is highlighted. To facilitate the development of self-leadership and responsibility in adolescents, a lecture on self-leadership, responsibility, and egocentrism is designed in the curriculum of a university subject entitled "Tomorrow's Leaders." The objectives, intended learning outcomes, lecture outline and materials are presented in this chapter. Issues surrounding this lecture are discussed.

INTRODUCTION

“To govern the country and bring peace and harmony to the world, one should first be able to regulate one's family; to orderly regulate one's family; one should first learn to cultivate oneself.” - Confucius from *The Analects* [1]

Manz [2] conceptualized self-leadership as “a comprehensive self-influence perspective that concerns leading oneself toward performance of naturally motivating tasks as well as managing oneself to do work that must be done but is not naturally motivating” (p. 589). Interestingly, the notion of self-leadership has long existed before Manz's [2] theoretical conceptualization. Traditional Confucian philosophy suggests precisely the idea that before one could successfully lead others, one must first be able to manage themselves. Because of its importance, the concept of self-leadership or self-cultivation is covered in the subject entitled “Tomorrow's Leaders” offered at The Hong Kong Polytechnic University. In addition, most existing leadership courses offered in university settings present students with theories and applications based on traditional leadership models which focus narrowly on “hard skills,” such as situational, task, manufacturing and management competencies that result in tangible outcomes (e.g., team performance). This in capacious focus, however, has been critiqued. For instance, Brass and Krackhardt [3] acutely observed that “largely ignored in leadership is an approach that focuses on the structure of interpersonal relationships” (p. 181), supported by Crosbie [4] who acknowledges the enduring value of “soft skills” and intangible outcomes of leadership.

Self-leadership refers to a process where individuals manage, influence, and lead oneself to establish self-direction and self-motivation to reach goals and perform effectively. The theory distinguishes itself from previous notions of self-management by addressing higher level standards of self-influence (e.g., intrinsic motivation of goal attainment and self-regulation) and suggests specific behavioral and cognitive strategies that enables individuals to exercise self-leadership [1]. Self-leadership strategies are divided into three broad categories. First, behavioral focused strategies facilitate self-awareness, enabling one to better manage their behaviors necessary to maintain performance standards. They include self-observation (i.e., being aware of reasons why one has to accomplish certain tasks), self-goal setting (i.e., setting challenging but attainable and specific goals), self-reward and self-punishment (i.e., being able to use appropriate rewards, such as commending oneself, when one demonstrates favorable goal-attaining behaviors, and use self-punishment, for instance, introspective examination of failure, when one is not performing up to standard), and self-cueing (i.e., providing environmental cues, such as to-do-lists and motivational posters, to encourage and prompt desirable behaviors). Second, natural reward strategies focus on making difficult tasks appealing and intrinsically rewarding. This can be achieved by making assignments inherently interesting by building enjoyable elements to tasks (e.g., decorating and personalizing one's workspace), or de-emphasizing unpleasant aspects of a task and focusing attention on the rewarding aspects instead. The last category is the use of constructive thought patterns, such as identifying dysfunctional beliefs and attitudes and replacing them with optimistic beliefs, positive self-talk or using mental imagery by visualizing success [5]. As reviewed by Neck and Houghton [6], self-leadership has been found to positively impact on individual and organizational outcomes, as evidenced by increases in commitment, job satisfaction, creativity, and positive affect. The positive

association between self-leadership and favorable performance outcomes may be mediated by psychological empowerment, and self-efficacy. Specifically, self-leadership creates a sense of competence, self-control, meaningfulness, or task responsibility [7]. Self-leadership enables one to take on increasing amounts of responsibility internally [8], which serves as a drive towards goal-attainment, as supported by findings of positive association between personal responsibility and motivational achievement [9].

Alongside with self-leadership, sense of responsibility is also important for an effective leader. Sense of responsibility is defined as “one’s positive attitude and obligations toward the fulfillment of tasks directly or indirectly assigned to him or her” [10, p. 74]. The notion was developed based on Adlerian’s school of Individual Psychology which emphasizes the need for humans to nurture abilities to meet five important life tasks, including, work, friendship, love, spirituality and universal values, and responsibility towards self [11]. Indeed, individuals engage in self-management by taking responsibility for ones’ decisions and outcomes, while feeling personally accountable for their performances and behaviors [12]. Various leadership models stress the importance of responsibility in effective leadership. Servant leadership entails the mission of responsibility to others, where servant leaders are accountable for the service they provide to their followers [13]. Transformational leaders take responsibility for the development of their followers [14], and accountability is an important dimension of ethical leadership [15]. Although most research investigating the relation between sense of responsibility and leadership were conducted in the West; values such as authority, order, and sense of responsibility are in fact, also inherent in the Chinese culture [16]. These deeply rooted ideologies and expectations of responsibility in adolescents persevere in spite of modernization and industrialization, as evidenced by Hong Kong parents who continue to believe that an ideal child should be able to fulfill their responsibilities within the family and in their studies [17].

Egocentrism is another important factor influencing leadership. Findings from studies investigating the relationship between self-leadership and personality traits often identify positive associations between self-leadership and socially desirable traits, such as, conscientiousness and extraversion [6]. Yet more recently, Furtner and colleagues [18] found narcissism to be associated with self-leadership. Narcissism is characterized by traits such as arrogance, excessive self-focus, self-absorption, and self-admiration. The authors explained that both self-leaders and narcissists possess high levels of need for achievement, which acts as a motivation for their persistence in the pursuing of goals. However, they differ in that narcissists focus on the outcomes of goal-achievement, whereas self-leaders focus on the process of achieving it. Self-leaders are driven by the intrinsic motivation from the tasks itself, while narcissists aim to obtain personal glory, self-enhancement, and admiration from others. Narcissistic leaders engage in self-promotion, self-nomination, deception, and manipulation [19, 20]. Self-preoccupational traits of egocentrism, greed, low levels of compassion and integrity are barriers to effective leadership [21]. More prominently, Shek and colleagues [22] investigated the egocentric phenomena in Hong Kong adolescents and found that over half of the respondents held egocentric beliefs that their own opinions were superior to others, and that fortune was always on their sides. The authors warned school psychologists and educators to pay close attention to this tendency that may bring deleterious influences to the healthy development of young people. As such, it is critical that while promoting self-leadership and responsibility in adolescents, educators should also warn students not to fall prey to the “dark side” of self-leadership [18].

Self-Leadership, Responsibility, Egocentrism and Adolescents

As self-leadership originated from organizational psychology literature, few studies directly explore the impact of self-leadership on adolescent behaviors and developmental outcomes. However, the role of self-management has been well-researched in both adolescent and student populations. Adolescents with high levels of self-regulation are less likely to engage in problem behaviors, including risky drinking, sexual behaviors [23], tobacco, alcohol, and marijuana use [24]. Non-delinquent adolescents perceive academic and career goals more important than delinquent youths and regulate energy to productive goal-attainment [25]. Furthermore, adolescents who made use of self-regulating cognitions (e.g., goal commitment, efficacy, and ownership) were more likely to engage in healthy eating habits [26]. The impact of fearfulness and frustration on both internalizing and externalizing problems were also attenuated by effortful control of attention and inhibiting behaviors among adolescents [27]. Shek [28] also found a negative relation between students' levels of mastery (i.e., perceived sense of control) and problem behaviors, supporting the self-efficacy model [29]. Academically, students who have higher levels of self-regulation were less prone to procrastination [30]. These adolescents monitor and evaluate progress, and regulate attention and effort to improve learning [31]. Adolescents' self-discipline was even found to be more predictive of academic success than intelligence [32]. The aforementioned findings support Manz's [2] model suggesting that self-leadership strategies function to enhance self-efficacy perceptions, which in turn results in higher levels of performance.

In terms of responsibility, most existing studies on adolescents focus on investigating family and social responsibilities. Findings suggest that adolescents with greater sense of responsibility to their families reported lower levels of depression, more intimate relationships with their parents, higher self-esteem [33], and higher academic motivation [34]. Adolescents' levels of social responsibility have been associated with civic engagement. Socially responsible youths were more likely to consider public interest as an important life goal and aim to improve their society and help their country [35]. In addition, social responsibility was positively associated with motivation achievement, as it facilitates learning and classroom performance, through increased positive interactions with teachers and peers [36]. In contrast to socially responsible adolescents' orientation toward collective-interest, self-interested, egocentric adolescents have trouble differentiating others' thoughts and their own mental preoccupations and self-obsessions. During social interactions, these adolescents anticipate others' reactions to be synonymous to theirs [37]. Egocentrism in adolescents have been associated with drunk driving [38], drug use, delinquency [39] and aggression [40].

Lecture on Self-Leadership, Responsibility and Egocentrism in "Tomorrow's Leaders"

Adolescents nowadays (born from 1980 to present) are coined as the Me Generation or Millennials, notorious for their egocentric tendencies. A recent article in the Time Magazine entitled "The me me me generation" [41] reported increasing prevalence of narcissism, as found in a nationwide study where 58% more college students scored higher on a narcissism scale in 2009 than in 1982. In addition, youngsters nowadays have unrealistic expectations on

job promotions (e.g., another study revealed that 40% of adolescents believe they should be promoted every two years, regardless of their work performance), and few of them want jobs with greater responsibility. Although most of the above studies were conducted with Millennials in America, in his article, Stein [41] claims that “even in China, where family history is more important than any individual, the Internet, urbanization and the one-child policy have created a generation as overconfident and self-involved as the Western one.” (p. 30). In a comprehensive review of adolescent developmental issues, Shek and Wong [42] identified mental health and problem behaviors, including depression, suicide, drug abuse, smoking and drinking among university students reared in the West, as well as Hong Kong adolescents [43]. Youths’ engagement in risky health-compromising behaviors has been attributed to their sense of egocentrism and the misperception of subjective invulnerability (i.e., the belief of indestructibility) [39], and possibly, their low sense of responsibility. Academically, students today are less mature and not ready for the responsibility that both being in college and young adults require of them [44]. Instead of using self-leadership strategies to reach academic goals, some adolescents procrastinate, and practice self-handicapping strategies by playing the evening before a test, deliberately allowing their peers to keep them from paying attention during class, and make external attributions for failure [45].

Although Stein [41] reported grave trends among the Millennials, he ended his article on a positive note, “a generation’s greatness isn’t determined by data; it’s determined by how they react to the challenges that befall them. And, just as important, by how we react to them.” (p. 35) Shek and colleagues [43] shared the same optimistic view on adolescence and suggested ways in which universities can respond to these emerging developmental adolescent issues. To tackle these problems, the authors proposed a curricular-based approach adopting the positive youth development model, including the promotion of constructs such as, emotional management (e.g., delaying gratification), cognitive competence (e.g., self-talk, decision-making), cultivation of self-determination, promotion of positive beliefs in the future, which are inherent to the nurturance of self-leadership, sense of responsibility, and holistic development in university students. Grow [46] also argued that “the goal of the educational process is to produce self-directed, lifelong learners. Many current educational practices in ... universities, however, do more to perpetuate dependency than to create self-direction” (p. 127). Lerner and colleagues [47] stress that “self-regulation processes must be integrated across childhood and adolescence for adaptive developmental regulations to exist and for the developing person to thrive” (p. 1). Hazard [48] further contended that training for university student success and achievement must go beyond traditional academic teachings in reading, writing, searching and organizing information, to incorporate the cultivating of “habits of minds.” One of the most important habits that college students should develop is taking responsibility.

Against this background, the teaching aims of this lecture on self-leadership, responsibility, and egocentrism are to introduce the respective concepts and theories and highlight the importance of self-leadership and responsibility in effective leadership. Students are also alerted of the detrimental effects of egocentrism on leadership and development. Regarding the intended learning outcomes, upon the completion of this lecture, it is expected that students should be able to: (a) introduce the concepts and theories of self-leadership, responsibility, and egocentrism; (b) recognize the relationship between self-leadership, responsibility, and egocentrism and leadership; (c) reflect on one’s own self-leadership, sense

of responsibility, and levels of egocentrism; (d) list various methods to enhance self-leadership. The teaching methods include lecture, group discussion, and self-reflection.

The lecture is organized into three main parts. In Part 1, the definitions and theories of self-leadership, responsibility, and egocentrism are presented. A warm-up activity (“Your Unique Peanut”) and a self-reflection exercise (“My Responsibility”) are conducted. In Part 2, the positive effects of self-leadership and responsibility, and the negative impacts of egocentrism on effective leadership will be discussed. A self-reflection activity (“How Well Do You Lead Yourself?”) is conducted. In the Final Part, strategies to promote self-leadership are introduced.

Warm-Up Activity

As lectures of “Tomorrow’s Leaders” are held on a weekly basis, in preparation for the current lecture on self-leadership, a week earlier, teachers distributed to each student a peanut and asked them to bring the peanut back in the following week. The lecture commenced with a warm-up activity, aimed to highlight the importance of self-leadership and responsibility and enable students to engage in self-reflection on their own self-leadership skills and ability to take responsibility of their behaviors in their daily lives. Teachers invited students to take out the peanuts that were distributed to them the week before. While the majority of the students remembered to bring their assigned peanuts back to class, some were unable to do so. Students were instructed to reflect on why they were or were not able to complete the task. Subsequently, teachers walked around the classroom and invited those who brought back their peanuts to share reasons behind the successful completion of the task. Different reasons were given by students; some claimed that they had put it in a safe place ensuring that the peanut would be untouched and intact, while others refrained from eating the peanut by reminding themselves about the instructions of the assignment. Teachers concluded the warm-up activity by leading the class to a round of applause to congratulate those who remembered to bring back their peanuts, as they demonstrated the important essence of self-leadership having effectively managed themselves in order to achieve a goal, and showed a sense of responsibility.

Part 1 of the Lecture

The first part of the lecture is dedicated to introducing the concepts and theories related to self-leadership, responsibility, and egocentrism. First, the definition of self-leadership is presented, and underlying processes including self-understanding and self-management are introduced. The notion of self-understanding was covered in an earlier lecture of the curriculum. Therefore, teachers invite students to recall the definition of self-understanding and to discuss in small groups. The discussion questions include “Why self-understanding is important for effective self-leadership?” and “What components of one’s ‘self’ do we need to better understand?” Teachers highlight the importance of being aware of one’s strengths, weaknesses, values, and directions in relevance to self-leadership.

Regarding self-management, students are reminded to accept and embrace their own uniqueness (self-acceptance), and to set personal standards (i.e., targets or goals), and devise strategies to control, monitor, and motivate oneself toward achieving personal goals (self-control). Second, the notion of responsibility is presented as “response-ability” (i.e., one’s ability to choose their response). Students are reminded of the conscious choice behind every decision they make and action they take in their lives, as guided by their inherent values.

Given this consciousness and free-will, individuals must therefore, take responsibility for their behaviors. Teachers then emphasize the fact that, as university students, we can fulfill our responsibilities in different domains: (i) to our self (e.g., exercising regularly, refraining from engaging in health-compromising behaviors, maintaining a healthy sleep schedule), (ii) to our family and friends (e.g., being good role models for our siblings, doing chores at home, being filial to our parents, supporting our friends), (iii) to our university (e.g., joining clubs and societies, attending lectures punctually, participating in class), (iv) to our society (e.g., engaging in voluntary work, being sensitive to current affairs), and (v) to our world (e.g., being environmentally friendly).

In order to facilitate students' self-reflection on their sense of responsibility, they are asked to complete a worksheet entitled "My Responsibility" (see Appendix 1). As students complete the worksheet, teachers engage in self-disclosure by sharing their own responses to the respective questions. To begin, students are asked to nominate an area of their life that they would like to improve on and to briefly elaborate on their wish. For instance, some students write about how they aspire to be more responsible students, specifically, be able to procrastinate less in their studies, while some reflect on their roles as sons and daughters, and how they want to communicate more with their parents to better understand them. Then, students rate on a scale of 0 (no responsibility) to 9 (full responsibility) how much responsibility they are currently exerting in their suggested area for improvement. Teachers highlight the fact that, even as adults, there are also areas in their lives that they wish to improve their sense of responsibility in. Lastly, students are asked to think of two things they can do differently to make a one-point increment on their score on the previous scale. Some examples of behavioral changes students proposed including setting goals, refusing classmates' invitation to go out until they complete their assignments, and trying to go home for dinner each night to spend more time with their parents. Teachers invite several students to share with the class their responses and suggestions. Students are reminded that sometimes we may find it difficult to act responsibly because we fail to see the consequences, especially negative ones, our actions may bring to ourselves or others around us. The concept of egocentrism and its characteristics are outlined, including one's inability to perceive the world in others' perspectives, the incomplete differentiation of the self and the outside world, over-preoccupation with one's own beliefs, and the assumption that others must share identical thoughts and feelings. Teachers conclude this section by stressing the importance of being responsible and avoiding egocentrism by considering others' feelings along with the impacts of our actions, as we take on different roles, and reiterate that everyone can improve on their sense of responsibilities with determination and motivation, as we are all self-leaders.

Part 2 of the Lecture

In Part 2, the importance of self-leadership and responsibility to effective leadership is highlighted. Students are reminded of their abilities to master their minds and Manz and Sims' [49] notion that "if you want to lead somebody, the first critical step is to lead yourself" (p. 25) is reiterated. Positive outcomes of responsible leadership are introduced. These include the ability to build trust among followers, gain support and respect from others, likelihood of becoming role models, particularly via ethical leaders' commitment to self-examination and accountability for ethical decision-making and behaviors. Lastly, egocentrism as a barrier to effective leadership is underscored.

In order to allow students to evaluate their own self-leadership, students are asked to complete the 35-item Revised Self-Leadership Questionnaire [50], consisting on subscales representing the three primary self-leadership dimensions. Regarding the behavior-focused dimension, subscales include self-goal setting, self-reward, self-punishment, self-observation, and self-cueing. The natural reward strategies dimension is measured with a subscale assessing individuals' ability to focus their thoughts on natural rewards, and lastly, constructive thought dimension is represented by subscales including, visualizing successful performance, self-talk, and evaluating beliefs and assumptions. Teachers introduce each of the self-leadership strategies and students are guided to calculate their scores for each of the subscales and to identify their strengths and weaknesses in the usages of the respective self-leadership strategies and to spot out which aspects they need to improve on.

Final Part of the Lecture

In the last section of the lecture, various strategies to enhance self-leadership with reference to the three self-leadership dimensions are introduced. First, students are encouraged to make use of behavioral-focused strategies, such as goal-setting, self-monitoring, and self-cueing strategies in achieving goals. Students are guided to set goals that are SMART (i.e., Specific, Measurable, Attainable, Relevant, and Time-bound). Second, students are encouraged to make use of natural reward strategies, by creating situations or environments that will enable them to be intrinsically interested in completing the tasks. For instance, photographs from the Google office in Zurich are shown to students. The office is creatively designed, with different themes and vibrant colors to allow employees to feel enthusiastic and inspired when they attend work. Students are persuaded to focus on the positive elements of a task and create reinforcing environments in order to turn mundane or challenging tasks to become more interesting. Lastly, constructive thought pattern strategies are outlined. The relationship between ones' thoughts and behaviors are highlighted, thus, students are encouraged to try to perceive events as positive, and use optimistic self-talk, rather than negative destructive self-talk, especially in times of set-back. Teachers conclude the lecture by reminding students that leadership is not confined to leading others, in fact, everyone can be a leader by leading themselves. In order to become effective self-leaders, though, one must be responsible to oneself and those surrounding them, and avoid being egocentric.

EVALUATION AND RELATED ISSUES

To what extent is the subject "Tomorrow's Leaders" able to promote positive development in the students? In a series of evaluation studies using different methods, including objective outcome evaluation, subjective outcome evaluation, and process evaluation, findings showed that the subject is able to promote psychosocial competencies in students [51-56]. For this lecture, post-lecture evaluation with the collection of quantitative and qualitative evaluation data reported previously demonstrated that students appreciated the lecture and felt that the lecture was able to promote their self-leadership and heighten their sense of responsibility:

- “This lecture is not about teaching me to lead others, but most important is myself. We are all leaders of our lives.”
- “It (this lecture) teaches us not to be egocentric and before being a leader of others, we must first manage ourselves. Those who know how to manage themselves will succeed in all that they do.”
- “We are responsible not only for ourselves, but also our family, friends, and the world.”
- “Be confident and strict to ourselves. Be caring, kind, and helpful to others. This is what I learned from this subject.”

Most educators or scholars would agree that there is no “cookie cutter” path to successful leadership [57]. Students are unique and each possesses their own potentials and weaknesses. What teachers can do, however, is to equip them with the necessary leadership and developmental competencies (i.e., the different topics in this curriculum) and more importantly, is to encourage students to take responsibility to lead themselves on this life-long journey. After all, as Lao Tzu once said “A journey of a thousand miles begins with a single (self-initiated!) step.”

Several conceptual and methodological issues should be taken into account when teaching self-leadership, sense of responsibility and egocentrism in a subject on leadership. First, conceptual integration of the leadership literature and adolescent development studies can be further attempted. For example, how self-reflection might shape leadership and adolescent development is an interesting theoretical question to ask. Second, it would be theoretically stimulating to integrate Western and Confucian literature on self-cultivation and fulfillment of one’s responsibilities. Third, while there are Western measures of self-leadership, no related scale has been developed in the Chinese context. Hence, more research is needed in this area. Practically, providing more opportunities for students to practice self-leadership and responsibilities is a desirable direction. Credit-bearing subjects like service learning are important vehicles for students to practice what they have learned in the leadership subject [58, 59].

ACKNOWLEDGMENTS

The preparation for this paper was financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is carried equally between the first author and second author. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

ABSTRACT

Social competence is an important positive youth development attribute for adolescent development and effective leadership. In this chapter, the definitions and approaches of social competence are introduced. The antecedents and consequences of social competence are highlighted. Moreover, the relationships between social competence and effective leadership, as well as adolescent development are also addressed. In particular, egocentrism as the barrier of social competence is discussed. To enhance social competence of university students, a lecture on social competence is designed in the curriculum of a university subject entitled "Tomorrow's Leaders". The objectives, intended learning outcomes, lecture content and special features of the lecture are presented in this chapter.

INTRODUCTION

University students are regarded as “tian ji jiao zi” (the favored son of the Heaven), and they are the skeleton of the future society. However, this generation has been commented as “Generation ME”, having portrayed as egocentric, narcissistic, depressed and not empathetic [1]. It is alarming that there was a big increase of the narcissism scores of contemporary university students when compared with the students in the nineties [2, 3]. Furthermore, in a meta-analysis of changes of dispositional empathy in American college students over the period of 1999 to 2009, Konrath et al [4] found that there was a sharp decline of empathic concern and perspective-taking of college students from after 2000. In Hong Kong, the adolescents were labeled as the “spoilt generation” who showed signs of narcissist traits [5]. Sadly to say, “Hong Kong Kid Syndrome” has been used to describe Hong Kong adolescents as “highly self-centered, short-sighted, over-reliant and unwilling to shoulder responsibility” [6]. Social competence, as one of the components of positive youth development, has become more and more important for adolescents to acquire in this era. As such, the attribute of social competence is covered in the subject entitled “Tomorrow’s Leaders” offered in The Hong Kong Polytechnic University.

DEFINITIONS AND APPROACHES OF SOCIAL COMPETENCE

Social competence is not a well-defined, unitary concept and its terminology interplays with “communication competence”, “interpersonal competence”, “social skills”, “relational competence” etc., reflecting the different conceptual and operational variations of the construct [7]. The variations bring the difficulties and complexity in defining and conceptualizing social competence.

Social competence has been defined as “the ability to achieve personal goals in social interaction while simultaneously maintaining positive relationships with others over time and across settings” [8, p. 285]. Other definitions include “an ability to build positive interpersonal relationships and to resolve interpersonal conflicts” [9, p. 380], the ability to ‘read’ and understand different situations, knowledge of social roles, and norms [10, 11], the ability to maintain favorable interpersonal relationships through cooperation, responsiveness, assuming responsibility, and behaving in friendly, warm, and other positive ways [12]. Under these definitions, three important elements should be noted. First, social competence is an ability of an individual. Second, interactions with others are focused. Third, positive interpersonal relationships are the expected outcomes.

In understanding how social competence works, different approaches are highlighted. The approaches provide different lenses for social scientists and researchers to examine the attribute. While peer status approach understands social competence based on how popular an individual is among his/her peers, the relationship approach assesses one’s social competence by the ability of an individual to develop positive interpersonal relationship [13]. The former emphasizes the popularity of an individual in his/her social circle, whereas the latter focuses on the quality of relationship built among partners. Both peer status approach and relationship approach are considered as the outcome-based approaches that emphasize social competence as the outcome attribute. The social skills approach, in contrast, is skill-based approach that

conceptualizes social competence to be the acquisition of the skills. Under social skills approach, social competence entails a set of desirable skills and behaviors that are effective in social interactions, including assertiveness, empathy, listening, defining problems, evaluating solutions, negotiation, expression of justified emotions, and realization of one's mistakes [13].

Last but not least, the functional approach suggests that social competence is context-specific and concerns with the identification of social goals. According to the information processing models of social skills [14], social behaviors are resulted from a multistep social-cognitive process that includes selection of social goals, monitoring the environment, formulation, selection and implementation of strategies, evaluation of outcomes, and finally the decision of an appropriate solution. Thus, social competence is regarded as the ability to make the process be an effective and functional one [13].

ANTECEDENTS AND CONSEQUENCES OF SOCIAL COMPETENCE

Similar to the other attributes, the antecedents of social competence are prone to nature-nurture debates. From a survey of literature, there are three factors contributing to social competence: temperament, attachment and parenting style [15].

Temperament is defined as “the characteristic phenomena of an individual's emotional nature including his susceptibility to emotional stimulation, his customary strength and speed of response, the quality of his prevailing mood, and all the peculiarities of fluctuation and intensity of mood” [16, p. 54]. It describes one's biological responses to the environment [17] that are related to activity, reactivity, emotionality and sociability of an individual [18]. Williamson and Dorman [15] suggested that there are four ways of which temperament may influence child's social competence: temperament may influence (a) child's exposure to potentially stressful situations; (b) child's range of sensitivity to stress; (c) patterns of child's social behaviors and emotional expressions; and (d) readiness of parents and others to engage the child.

Attachment refers to “a long-lasting relationship characterized by a strong emotional bond between two individuals” [15, p. 19]. Attachment provides a secure foundation for social experiences. Attachment helps to satisfy the physical survival needs as well as social emotional needs of the child, provide them with chance for learning the rules of interactions, and help to shape beliefs and expectations on social engagement [15]. Zeanah et al [19] identified four patterns of attachment: secure, avoidant, ambivalent and disorganized/disoriented. It was found that the secure pattern of attachment was related to social competence. Children growing up with secure attachment were generally more cooperative, sociable and competent than with the other attachments.

Finally, the socialization practice of parents influences social and emotional development from infancy stage to adolescence. Maccoby and Martin [20] classified parenting style into two-dimensional framework: parental demandingness and parental responsiveness. While parental demandingness expects parents to be more restrictive and firm in monitoring and supervision of their children, parental responsiveness entails qualities of sensitivity, warmth, encouragement and closeness through responding to the needs of the children [21]. Four types of parenting styles (authoritarian, authoritative, permissive, and neglected) are emerged [21] from the categorizations. It was found that authoritative parenting style (high levels of

parental demandingness and responsiveness) influences social competence of children and adolescents [22, 23].

Undoubtedly, social competence is very important for adolescent positive development and psychosocial wellbeing. In a longitudinal study of social functioning of 261 Chinese adolescents, Chen et al [24] identified that sociability-leadership and shyness-sensitivity in childhood influenced leadership, academic achievement, and self-perceptions in adolescence, whereas aggression in childhood predicted externalizing problems (e.g. delinquent behaviors) and negatively influenced academic achievement in adolescence. Luthar [25] in a longitudinal study further found that social competence was associated with depression in inter-city teenagers. Echoing with the results, Burt et al [26] also identified the robust negative path of social competence in predicting the internalizing problems (anxiety, depression, withdrawal and somatization) from childhood to adolescence. As a summary, high social competence may result in good leadership, academic achievement and high self-esteem of adolescents, whereas low social competence may result in psychopathological problems and delinquent behaviors.

SOCIAL COMPETENCE AND LEADERSHIP

Social competence has been regarded an essential competence for leadership excellence [27]. It forms the basis for a spectrum of favorable developmental outcomes, including self-esteem, achievement, responsibility, and leadership qualities [24]. Generally speaking, there are four aspects of social competence that are important for effective leadership: self-awareness, self-management, social awareness and relationship management [28]. Self-awareness is the accurate self-assessment of one's strengths, limitations, values and motives. One needs to be honest to oneself, realistic and self-reflective. Self-management consists of the attributes of emotional self-control, transparency, adaptability, achievement, initiative and optimism. They manage their emotions, maintain clear mindset, and provide energy for action. Social awareness is the sensitivity to understand how others feel, think and action. This included empathy (understanding others and taking active interests of their concern), organizational awareness (perceiving the political relationships within the organization) and service orientation (recognizing and meeting others' needs). Last but not least, relationship management is the ability of handling relationships and moving people to the right direction. This involves influencing, developing others, change management, conflict management, building bonds and teamwork.

In respect of social skills approach, Riggio and Reichard [29] classified three components of social competence: Social expressiveness, social sensitivity and social control. Social expressiveness is the skill in verbal expression and the ability to engage others in the social interactions. It is essential for a leader in public speaking, persuasion and coaching. Social sensitivity consists of the ability and skills to read and interpret the verbal and non-verbal messages of others, understand the social situations, norms and rules, be aware of others' needs and feelings, and respond to them appropriately. Active listening, regulation of the social behaviors are necessary for a leader. Social control addresses the issue of knowing what should be done in social interactions. This involves the skills in role-playing and social

self-presentation, which are essential for a leader to develop emotional control, sense of confidence and self-efficacy in social situations.

SOCIAL COMPETENCE, EGOCENTRISM AND ADOLESCENT DEVELOPMENT

During the past two decades, the advancement of information technology that stretched all spheres of our daily life [30], the globalization in economic, political and cultural arenas [31], as well as the high levels of parental involvement and care [32] have helped to “generate” the next generation into the “Generation ME” [1], or “Generation Y” [33], who are regarded as egocentric, narcissistic, cynical, depressed and not empathetic [1]. Shek and Wong [34] termed the “dark-side attributes” to describe some of the negative attributes that affect the healthy development of the adolescents. Egocentrism, in particular, is the cognitive barrier for the promotion of social competence.

Egocentrism is “a descriptive concept of a state of undifferentiation between the self and the nonself, as the individual is confined to a highly personalized point of view while ignorant of the uniqueness of others’ perspectives” [35, p. 208]. It is characterized by the state that an individual has a preoccupation with one’s own internal world, and an incomplete differentiation between the self and the world. He/she may assume that others have the same thoughts and feelings as his/her. As a result, the individual tends to perceive, understand and interpret the world in terms of the self, without taking others’ perspectives into considerations.

Egocentrism originally refers to an early cognitive developmental stage that exhibits over-emphasis of self and a lack of differentiation in areas of subject-object interaction [36, 37]. Elkind [38, 39] suggested that egocentrism re-emerges at the transitions of each cognitive developmental stage. In early adolescence, egocentrism is characterized by manifestations of the imaginary audience and the personal fable. Imaginary audience describes to the situation that adolescents believe that there is some audience who is overly interested in their deeds. Personal fable refers to the situations that adolescents perceive that they are always unique in feeling, thinking and actions [40]. Normally, adolescent egocentrism will diminish in late adolescence and adulthood, when formal operational thought is consolidated [38]. However, more and more studies identified that egocentric tendencies have extended to late adolescence and early adulthood [41-43].

As suggested by Goleman [28], “self-absorption in all its forms kills empathy, let alone compassion. When we focus on ourselves, our world contracts as our problems and preoccupations loom large. But when we focus on others, our world expands. Our own problems drift to the periphery of the mind and so seem smaller, and we increase our capacity for connection - or compassionate action” (p. 54). Egocentrism is the enemy of social competence. There is empirical evidence that egocentric lifestyle and behaviors hamper the development of empathy and social competence [44-46].

WAYS TO PROMOTE SOCIAL COMPETENCE

Social competence has been regarded as a “relative competence” [47] that can be developed and refined through practice. There are some ways for promoting social competence. First, self-awareness and determination is essential in understanding one’s own capacities and recognizing other’s. Being aware of the norms, cues and patterns in social interactions may help one to interact with others smoothly and harmoniously. Second, observation and modeling of the behaviors of others who have high social competence may help to improve one’s social skills. Genuine feedback from others is always the medicine to improve oneself. Third, positive body language is critical in non-verbal communication. The SOFTEN technique (smile, open posture, forward lean, touch, eye contact and nod) [48] is simple, practical and useful in improving one’s non-verbal communicative skills. Fourth, effective conflict management strategies (forcing, accommodating, avoiding, compromising and collaborating) [49] are important in resolving conflicts that may inevitably happen in social interactions. Fifth, empathy is the milestone to understand and respond to the needs and situations of others. Empathy is more than a social skill, it is the capacity of an individual to understand and react with others through observed experience [50]. Thus, empathic listening and responses are essential in social interactions. Last but not least, social skills are developed and refined over time through implementation [47]. Hence, patience and practice are the keys for promoting social competence.

LECTURE ON SOCIAL COMPETENCE IN “TOMORROW’S LEADERS”

The lecture aims at enhancing the knowledge, understanding, and skills of social competence to the students. In this lecture, the definitions and concepts of social competence are introduced to the students. The antecedents and consequences of social competence, and the relationships between social competence and leaderships as well as adolescent development are highlighted. Finally, the strategies and skills to promote social competence are also presented. Regarding the intended learning outcomes, upon the completion of this lecture, it is expected that students should be able to: (a) understand the definitions, theories and concepts of social competence; (b) identify the antecedents and consequences of social competence; (c) realize the relationship between social competence and leadership; and (d) be familiar with the ways of promoting social competence. The teaching methods include lecture, reflection exercises, video sharing, experiential learning activities, role-play, group discussions and self-reflections.

There are four important features in the teaching content and methods in this lecture. First, self-reflections are the important tools for the students to critically examine their social competence as well as the relationships with others, including the peers, friends, and family members. Thus, in each part of the lecture, students are requested to reflect on their attitudes, perceptions, and capacity of social competence and critically discuss the related controversial issues. Second, students may perceive that social competence is an in-born attribute guided by the introversive-versus-extroversive personality. In fact, it is a relative competence that can be learned and developed through practice [47]. Hence, it is essential to clarify the misconception and encourage the students to enhance their social competence through

practice. Third, social competence not only involves theories and concepts, it also involves an array of social skills. Thus, the practice of social skills is highlighted throughout this lecture. Fourth, the class can serve as a platform for students to practice social competence through interactions. As such, interactive activities are provided in this lecture so to facilitate interactions among students and between teacher and students.

The lecture covers four parts based on the intended learning outcomes. The first part presents the definitions and concepts of social competence. The second part highlights the antecedents and consequences of social competence. A self-reflection exercise is performed to encourage students to reflect on how family life and relationships with family members affect their social competence. The third part discusses the relationship between social competence and leadership. A video clip of “Story of a master’s degree holder” is presented and students are requested to reflect on the problems of egocentrism to adolescent development. The fourth part suggests the ways and strategies to promote social competence. A group activity of “collaging the tips of social competence” is introduced to allow the students to brainstorm the practical and useful methods in promoting social competence. Furthermore, empathy, as an important attitude and skill in social competence, is emphasized for the students to acquire and practice. Two cases are given for the students to practice empathic listening and responses. Students are invited to role-play the scenarios. Finally, more reflective questions are suggested for the students to reflect on their own perspectives on social competence.

In the first part of the lecture, the definitions and concepts of social competence are introduced. As a warm-up activity, some pictures and photos related to social competence (such as the smiling face, the “Like” icon in Facebook) are shown. Students are invited to share their associations of the pictures with their impression of social competence. After that, the concepts and approaches are introduced to the students. In each approach, students are encouraged to self-reflect on their social competencies.

In the second part, the antecedents and consequences of social competence are presented. Social competence is a socially learned construct that one experiences and learns through the socialization process in life [7]. Family, as a vital system of socialization where social competence is nurtured, is worthwhile for the students to examine their relationships with their own family members as well as the impacts to their social competence. Hence, apart from the lecture, there is a self-reflection exercise entitled “My family dining table” to help the students to do their reflections. A worksheet (see appendix 1) is distributed to the students. Each student is requested to draw a simple floor plan of his/her family dining table and indicate the seating arrangements of the family members. A facial emotional expression for each family member is drawn on the worksheet. Finally the interactional patterns among the family members are indicated. In their reflections, the three antecedents of temperament, attachment and parental styles are highlighted to examine their impacts to the development of social competence. The teacher will use his/her own “family dining table” to illustrate the requirements of the exercise, and share with the students on how family relationships influence his/her social competence. Group sharing on their reflections is encouraged, and some students are invited to share their reflections in class. As the sharing might be sensitive and personal when touching their relationships with the family members, it is advised that the teachers should be sensitive to the readiness as well as the emotions of students.

The third part introduces the relationship between social competence and leadership. The components of social competence (social expressiveness, social sensitivity and social control)

suggested by Riggio and Reichard [29] are presented. Subsequent to the lecture, a video of “The story of a master’s degree holder” is presented to the students. The video presents the story of a Master’s degree holder who was graduated from an international university in Hong Kong but failed to obtain a job from the job market after attending more than 200 job interviews. He finally had to depend on social welfare assistance to support his life for three years. The video presents his perceptions and justifications of his joblessness, as well as his performance in a mock job-interview offered by a human resources consultant. From the sharing of the video, while most of the students could spot out the lack of social skills possessed by the master’s degree holder, but only a few could point out the heart of his problem was due to his egocentric characters. After the sharing, it is more important to invite the students to reflect on their own social competence, in relations to the egocentric lifestyle and behaviors that become salient nowadays. Following the reflections, the four aspects of social competence for effective leadership (self-awareness, self-management, social awareness and relationship management) suggested by Goleman et al [51] are introduced.

The fourth part suggests the methods and strategies in promoting social competence. As social competence is a relative competence that can be learned through practice [47], it is essential for students to explore useful and practical ways in promoting their social competence. A group activity on “Collaging the Tips of Social Competence” is conducted. In the activity, each group is given some magazines. Students are required to select the wordings, pictures, photos and whatever they find simulating in representing and enhancing social competence and cut them out from the magazines. They then design a poster comprising the “meaningful” materials that they have cut out from the magazines, and discuss how these materials promote social competence. Finally, they are requested to share the ideas of the posters in class. In the activity, it is interesting to observe that the students concentrated on their own piece of work initially, without communicating with others. However, after selection of a pool of materials, they started to communicate on the themes and ideas of the poster. They practiced the social skills of listening, assertiveness, negotiation, conflict management etc. and came out with the themes of the poster. Then students re-examined the magazines again according to the themes. But during this time, they would ask the opinions of the other group members. The representatives introduced the posters systematically, and they understood that the poster is the group’s masterpiece. The materials and themes they selected were also very thoughtful, such as “thankfulness”, “walk in other’s shoes” (empathy), “free from prejudice and discrimination”, etc. The posters and presentations not only suggested the possible ways in promoting social competence, they also represented their desires and aspiration in friendship and interacting in the social world. After the activity, the teacher will debrief the activity based on his/her observations and introduce the tips for developing social competence.

As empathy is the milestone on promoting social competence and there is evidence that students are getting less empathic nowadays [4], practice on empathic listening and response is provided during the lecture. After the introduction of the concept of empathy, two scenarios are provided to the students (see appendix 2). The first scenario is that a friend’s father had been jobless for three months, and the friend seemed stressful and depressed when sharing the financial hardship of the family. The second scenario is that a good friend was pregnant and she was extremely anxious and stressed because she was not prepared to have a baby. The students are invited to role-play the scenarios in pairs, one will act as the character of the scenario and the other will practice the empathic listening and response. The teacher further

invites one pair to role-play the scenarios in front of the class. This is another valuable experience of the students, as most students would keep on giving advice and suggestions to the characters after knowing the information, without addressing to the emotions of the characters. The genuine sharing of the students (the characters) after the role-play is definitely a challenge to the students on their ways to understand and help others. This would help them reflect more on their previous experiences when sharing with friends and significant ones in times of sorrows and adversities. Teacher will soon demonstrate the skills and techniques of empathic responses to the students based on the scenarios.

Finally, the teacher will round up the lecture by encouraging the students to self-reflect their social competence, as well as emphasizing that social competence can be learned and developed through practice.

To what extent is the lecture beneficial to promote the social competence of the students? The quantitative and qualitative data of post-lecture evaluation reported that students appreciated this lecture very much, especially on the usefulness and practicability of the lecture content. There are some qualitative feedbacks from the students:

- “This lesson is really useful to us as social competence is essential to our daily lives. I’ve learnt how to comfort people from this lecture.”
- “It is a good time to think about my friendship. Good lecture!”
- “Never think of saying words of empathy =) more powerful than the others.”
- “The lesson is gonna be very interesting and funny. Rather than cramming theories in our mind, but teach something useful. I love this lesson!”
- “I had learnt how to help my friends.”
- “It makes me understand the importance of dealing with social competence by sincere & trust.”
- “The tutor asked students to do role-play, this made learning more two-sided and interactive.”
- “I learn some social skills which help me easier to communicate/ connect to others.”

There is an inspirational quote from Albert Camus [52]: “Human relationships always help us to carry on because they always presuppose further developments, a future -and also because we live as if our only task was precisely to have relationships with other people”. Social competence, as the bridge of human relationships, should be nurtured and developed as a curriculum in the universities.

ACKNOWLEDGMENTS

This work and the course on ‘Tomorrow’s Leaders’ are financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The authorship is equally shared by the two authors. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

MY FAMILY DINING TABLE

4. Draw a simple floor plan of your family dining table.
5. Indicate the seating arrangements which should include all your family members.
6. Draw a face with emotional expression for each family member and indicate the interactional patterns of your family.

Reflective Question

*How does your family life affect your present
social competence?*

APPENDIX 2.

**The Hong Kong Polytechnic University
Department of Applied Social Sciences**

**APSS1L01Tomorrow's Leaders
Lecture Nine: Social Competence**

Scenario A

Your friend, Mike, just told you that his father lost his job 3 months ago. Mike seemed stressed and depressed. When he talked about the financial hardship of his family, he burst into tears in front of you.

How Would You Respond?

Think about three sentences and one action that might help the person feel better.

Scenario B

Your best friend, Jenny, just told you that she got pregnant. As a first year university student, she was not prepared to have a baby. She told you that she felt extremely anxious and stressed.

How Would You Respond?

Think about three sentences and one action that might help the person feel better.

ABSTRACT

The curriculum of a lecture about spirituality in the course entitled “Tomorrow’s Leaders” developed by The Hong Kong Polytechnic University is introduced in this chapter. With reference to the basic tenets of outcome-based learning, the intended learning outcomes and the curriculum structure are illustrated. The following topics related to the construct of spirituality are included in this paper: definition and basic concepts of spirituality, theories of spirituality, antecedents of spirituality, spirituality and adolescent developmental outcomes, spirituality and leadership, and ways to promote spiritual leadership. Topics for reflections are also presented at the end of the chapter.

Keywords: spirituality; life meaning, leadership subject, curriculum development

INTRODUCTION

Although religion has been regarded as an important influence in the lives of people, there is no agreed upon definition of spirituality. Scott [1] examined 31 definitions of religiousness and 40 definitions of spirituality. It was concluded that these conceptions could be subsumed under nine content areas, including connectedness or relationship, processes contributing to higher level of connectedness, reactions to sacred or secular things, beliefs or thoughts, traditional institutional structures, pleasurable existence, beliefs in the sacred or higher being, personal transcendence, and existential issues and concerns. Markow and Klenke [2] similarly suggested that there were more than 70 definitions of spirituality in the context of work. According to Myers, Sweeney and Witmer [3], spirituality can be defined as “personal and private beliefs that transcend the material aspects of life and give a deep sense of wholeness, connectedness, and openness to the infinite” (p. 265). Along this line of thought, meaning and purpose of life, hope and optimism, love and compassion, moral and ethical guidelines, related thoughts, feelings, and behaviors are essential elements in spirituality.

While spirituality is always associated with religion, there are some distinguishing features between spirituality and religion. First, religion is the search for significance in ways related to the sacred whereas spirituality is the search for the sacred. As such, religion is finding the means to reach the end while spirituality is a more general feeling of closeness and connectedness to the sacred. Second, religion is about the adherence to a belief system and practices associated with a tradition in which there is agreement about what is believed and practiced. However, the sacred in spirituality is often a socially influenced perception of either (a) a divine being or object or (b) a sense of ultimate reality or truth.

According to Worthington et al. [4], there are four types of spirituality, namely humanistic spirituality, nature spirituality, religious spirituality, and cosmos spirituality. First, humanistic spirituality refers to the closeness and connection to mankind. Second, nature spirituality refers to the closeness and connection to nature. Third, religious spirituality refers to the closeness and connection to the sacred defined by religion. Fourth, cosmos spirituality refers to the closeness and connection to the whole of creation.

While Worthington categorized the four types of spirituality in a macroscopic view, Lau [5] contextualized spirituality in a narrow way to show that there are three key elements on the spirituality of Chinese, namely connectedness to others, personal beliefs and values, and meaning of life. The first element, “connectedness to others” refers to a two-dimensional model to illustrate a person’s transcendent relationship with the higher being (vertical dimension) and the relationship one shares with himself/herself, others and the environment in connectedness (horizontal dimension). The second element, “personal beliefs and values” means that different types of spirituality provide a variety of beliefs and values that guide our behaviors and/or answer some essential questions surrounding life and death issues [6]. Lastly, “meaning of life” is contributed by three sources that a career to which a person commits oneself (creation), some beautiful things or love of others appear to a person (experience), and the active choice of a person’s attitudes (attitude) [7].

ANTECEDENTS AND CONSEQUENCES OF SPIRITUALITY

There are many factors influencing the development of spirituality. Adopting an ecological model, factors on different levels shape the development of adolescent spirituality [8-10]. For example, in a longitudinal study to examine the factors influencing adolescent spirituality, Regnerus, Smith and Smith [11] found that parents and friends had strong impact on the development of adolescent's religious spirituality while country-level influences seemed to be minimal. Parents' religious behavior and expectation shape the spirituality in adolescents and young adults strongly. Besides, peer influence, maternal communication, and paternal affection exert strong impact as well.

In fact, developing adolescent spirituality is essential due to the fact that it will promote adolescents' physical health, psychological well-being, and at the same time reduce the effect of psychopathology and stress and turnover. Based on the theory of logo therapy proposed by Victor Frankl [12], existential vacuum (i.e., loss of meaning in life) is a precursor of mental problems and adjustment problems. According to Emmons [13], religion provides goals and value system that shape life meaning which would eventually promote quality of life. Powell, Shahabi and Thoresen [14] also provided evidence suggesting the positive relationship of religion on health outcomes. In the context of the workplace, adolescent spirituality not only reduces the possibility of employee absenteeism, but also increases employees' productivity, ethicality, and health [7, 15-17].

SPIRITUALITY AND LEADERSHIP

After considering the basic nature of spirituality, it is important to examine the relationship between spirituality and leadership. Spiritual leadership refers to the intrinsic motivation towards oneself and others. Based on this definition, a person perceives work as a calling in a sense that spirituality as the source of their motivation. Besides, a person who helps other scares about their own development of their body, minds heart and spirit. Nonetheless, spiritual leadership intrinsically motivates oneself and others through developing inspiring vision and mission statements that foster a spirit of cooperation, trust, mutual caring, and a commitment to organizational effectiveness. Last but not the least, a spiritual leader should be competent to gain followers' acceptance in terms of credibility, teaching, trust, inspiration, and to be knowledgeable about the group's work.

According to Greenleaf [18], the concept of servant-leader based on the assumption that servant-leader is a servant first. It begins with the natural feeling that one wants to serve, and then conscious choice brings one to aspire to lead. Servant-leaders give priority attention to the needs of their colleagues and those they serve. As such, servant-leadership consists of the following characteristics: listening, empathy, healing, awareness, persuasion, conceptualization, foresight, stewardship, commitment to the growth of people, and building community.

The characteristics of servant-leadership suggested by Greenleaf are closely related to six spiritual practices for leadership effectiveness. First, demonstrating respect for others' values is essential in leadership effectiveness. A leader respects values of followers, creates empowerment rather than dependency, and promotes sustainability rather than short-term

success. Also, a value-based leader's behavior has powerful effects on followers' motivation and work performance. Second, treating others fairly is also an important practice for an effective leader. In fact, justice and fairness are values important to spirituality. Therefore, treating others fairly is a natural consequence of viewing them with respect. In contrast, treating others unfairly indicates a lack of respect, compassion, and integrity. Third, effective leadership will express care and concern. The leader will emphasize individualized consideration, such as coaching followers, listening, and attending to individual needs and desires. The leader will also place people over strategy since that he/she values person-person interaction more on relational quality rather than functional quality. Along this line of thought on relationship building, the leader will express care and concern goes beyond the organization to make a commitment to the community. Fourth, an effective leader would listen responsively. He/she acknowledges the concerns of employees, and at the same time recognizes and respects good ideas. Fifth, an effective leader will appreciate the contribution of others. The appreciation of others serves as worthy of respect and praise to others. When leaders recognize employees' contributions, employees feel a stronger sense of belonging to the community, more likely to stay with the organization and continue to contribute. Lastly, an effective leader will engage in reflective practice. He/she will take time for individual self-examination and/or communication with God [19]. Some common practices include prayer, journaling, meditation, and spiritual reading.

WAYS TO PROMOTE SPIRITUALITY

Several strategies can be used to help students develop their spirituality. For example, Shek [8] suggested that understanding different forms of religions and spirituality via different media can foster the development of spirituality. He further suggested that active reflection on spiritual questions is effective to deepen adolescents' spirituality. For example, "why do we exist?", "where are we going?", "is there any life after death?", and "what should we do when we are still conscious?" are inspirable questions for adolescents to reflect on personal growth and the life goals of this world and of the metacognitive world. In fact, these are important spiritual questions demanding conscious reflection. Similarly, Bruce and Cockreham [20] suggested that adolescents could gain more spiritual experiences through joining religious groups, church activities, spiritually related gatherings, and meditation.

Meditation is another strategy that can help students to develop their spirituality and reflection. The word "meditation" is derived from two Latin words—*Meditari* and *Mederi*. *Meditari* means to think, to dwell upon and to exercise the mind where *Mederi* means to heal. Based on this understanding, mediation is defined as an art of stilling the mind that helps an individual overcome negative emotions. Besides, meditation is a technique to reduce stress and gives you a peaceful mind. According to Benson, Beary and Carol [21], there are four steps in meditation. First, it is necessary to have a quiet environment. Then, a mental device is needed so that the meditator can focus his/her attention on a constant stimulus. In order to calmly redirect attention to meditator's mental device, a passive attitude is required. Lastly, the meditator should have a comfortable position by simply sitting up. After introduced the definition and the steps of meditation, it is always helpful that an activity is assigned to students for them to apply the knowledge acquired.

OVERVIEW OF THE LECTURE

Catalano et al. [22] highlighted 14 positive youth development constructs that are essential to the all-rounded development of adolescents. Utilizing some of the related constructs, a credit-bearing subject entitled “Tomorrows’ Leaders” was developed and implemented at The Hong Kong Polytechnic University to promote the intrapersonal and interpersonal skills of the students. Aligning with the major aims of the course, the lecture about spirituality has the following objectives: a) to theorize the definitions and basic concepts related to spirituality; b) to summarize the antecedents and consequences of spirituality; c) to explain the relationship between spirituality and leadership; d) to explore ways to promote spirituality; and e) to appreciate the conceptual and practical issues surrounding spirituality. As far as learning outcomes are concerned, through engaging students in an active learning environment, it is expected that students will be able to understand a) the definitions, basic concepts, and theories related to spirituality; b) the antecedents and consequences of spirituality; and c) the relationship between spirituality and leadership. Besides, they will be able to apply the knowledge through participating in individual and group activities in order to experience ways to promote spirituality for themselves. Finally, the lecture will illustrate some conceptual and practical issues surrounding spirituality for students to generate new ideas about the spirituality construct.

THE OVERALL STRUCTURE OF CURRICULUM

The curriculum is designed to put emphasis in facilitating students’ understanding about spirituality in terms of theories and practices. While theories are used to build up the conceptual framework for students to understand spirituality, practices during the lecture are used to deepen students’ understanding through having application and/or synthesis of new ideas about spirituality. The lecture is started with playing a song to raise students’ awareness of thinking the meaning of life. Some issues/questions are raised, such as: *Why are we here? What’s life all about? What is life? What is our fate?* Then, the lecture is structured in five sections, including definitions and theories of spirituality, antecedents and consequences of spirituality, spirituality and leadership, spiritual practices for leadership success, and ways to promote spirituality. The topics are arranged from the understanding of spirituality towards the relationship between spirituality and leadership, and ultimately lead to a practical side on the qualities of spiritual leadership. To conclude the lecture, several reflective questions and issues related to spirituality are being raised for students to think after class: What is the meaning of spirituality in your life? How are individual, family, and social factors related to adolescent spirituality? It is expected that these questions can promote the learning experience extending after the lecture. The lecture outline for the students can be seen in appendix A.

REFLECTIONS AND CONCLUSION

Teaching spirituality cannot be done solely by transferring knowledge theoretically. Indeed, spirituality is an experiential knowledge that requires students to practice as well. The

design of this curriculum to teach spirituality has been well structured in order to make a well balance of the two. On one hand, theories about spirituality can be delivered to provide basic understanding about the conceptual framework of spirituality in the earlier part of the lecture. On the other hands, students have the opportunity to practice and therefore be able to re-enter into their personal experience which turns to become a re-visit of their lives as spiritual journeys at the latter part of the lecture. Having said that, there is room to further enhance the constructive alignment between the intended learning outcomes, teaching and learning activities and the assessment tasks of this lecture in order to enriching students' learning experience in this subject matter.

In fact, knowledge and skills are inter-related. According to Chan [23], students can learn best with daily-life examples in problem-based learning. Besides, as Franklin [24] mentioned that, spirituality is "a spiritual awareness needs to be impressed on students to effect a positive influence in their life; it is a way of thinking, being and living" (p. 2). In view of the current curriculum, although there are two activities to engage students in personal reflection, there is a gap to demonstrate spirituality as an experiential knowledge to students. One way to fill in this gap is to provide a real case for students to associate with the conceptual framework of spirituality acquired in the first part of lecture. The teacher can provide a real case by either sharing his/her personal testimony or writing up a case scenario based on the real case of others or the public. Following the case scenario shared with students, reflective questions will be given for students to think of the situation. At this point, the questions should be set in order to allow students to apply their understanding of the concepts about spirituality, and therefore synthesize new ideas about the topic. Below is an example of a case scenario which can be used to enhance the learning experience of students:

CASE SCENARIO

This case scenario is based on the personal testimony of the second author:

"When I was pursuing for my first degree in Vancouver, Canada, I joined the count-down activity with my friends in my church fellowship in the last night of December every year. One night, after we had finished the count down in one of our friends' home, I drove my friends back home as usual in mid night. At that time, the temperature was low (nearly zero degree Celsius), the wind blew and no one on the street. Suddenly, a car was coming very fast and then had a head-on collision towards the left hand side of my car. Without any notice and in a split of second, I felt that my car was spinning for several rounds. After the car had come to stop, I found that all the windows were broken, and by natural instinct, I climbed up from the side window and then got out of the car. The first person I saw was one of my friends. He was lying on the icy street a meter away from my car while his hands were shaking. Then, I looked back and I found that one of passengers were hanging on the side window and the other one's head was bending down and felt unconscious.

Within few minutes' time, nine ambulances arrived and brought all the patients from the two cars to hospitals nearby. While I was not having serious injury, I stayed in a police car to keep warm. At that time, I felt that I was so weak and could not do anything for my friends but just sitting there to wait for my homestay parent to come. My anxiety climbed so high and

I blamed myself so much that I was the person to make this accident happened. As my homestay parent came, I took on his car and we went to visit my friends in the hospitals. Also, I needed to phone the relatives of my friends about the accident. As a visa student, it was hard for me to speak up to tell their relatives that I was the one to induce this accident and asked them to go to hospital at the same time. In the journey, my homestay parent and I did not talk so much. The silence in the car echoed with the dark night outside. At that time, I felt mysterious. Suddenly, he held my hand and said, "The end of man is the beginning of God". Immediately, my tears came out after I heard this. In fact, after the accident happened, I did not cry at all not because I was brave enough, but I just suppressed my emotion that I didn't know how to cry. Indeed, his phrase did give me insight and hope, which granted me strength to carry through.

At last, my friends came out from the hospitals and we all had no major damage on our health. Also, the court judged that the driver of the other car had the 100% responsibility in this accident. By that time, I was relieved."

With reference to this case, reflective questions are being set to deepen students' understanding about spirituality and the application on spiritual leadership. The level of questioning is starting from a surface level to a deeper level that higher order thinking is required for students to provide in-depth feedback. Depending on the availability of time, the reflective questions can be discussed in the group or open class discussion contexts.

1. The author came to an intersection of life and death. How would you feel if you were in the same circumstance that your friends were injured after the accident was happened? Will life and death be an issue to you by that time? Why or why not?
2. The author came to an emotional break down after the accident. He seemed to be disconnected to his friends or even himself in the police car. Do you think you will behave similarly or you will do something in order to stabilize your emotion? How?
3. Do you agree that "the end of men is the beginning of God"? How do you perceive if there is any supernatural power in this universe?
4. If you were the boss of this author, how would you write him a letter to encourage him from recovering from this bad experience? Try to integrate the characteristics of a spiritual leader (listening, empathy, healing, awareness, persuasion, conceptualization, foresight, stewardship, commitment to the growth of people, building community) in your letter.

In all, teaching spirituality is not an easy task since there is no absolute answer to individual's life which is intrinsic and intrapersonal [24]. Perhaps asking students to write their personal reflection would be a good assessment task for and of their learning so that students can be able to re-visit their past experience and then come up with insights to live fruitfully. In future, some issues are worth to explore. For example, the contextualization of the theories of spirituality in local Hong Kong context, and the integration of spirituality and spiritual leadership in students' lives are the essential for the sustainable development of adolescence. Based on the successful experience of developing and implementing positive youth development programs like the Project P.A.T.H.S. in Hong Kong [25, 26], it would be an attractive option to develop curricula-based spirituality promotion program in the university context. The subject "Tomorrow's Leaders" is a pioneer example in different Chinese contexts.

ACKNOWLEDGMENTS

The preparation for this paper was financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

APPENDIX A: OVERVIEW OF THE LECTURE (HANDOUT TO STUDENTS)

Spirituality can be defined as “an awareness of being or force that transcends the material aspects of life and gives a sense of wholeness or connectedness to the universe”. The growth in spirituality is an inner developmental process that helps a person to change and to connect with the universe. Researchers have found that spirituality has significant effects on different aspects of youth development and contributes to adolescents’ active participation in social activities. Thus, it is important for our university students, tomorrow’s leaders, to gain a clear understanding of spirituality and how it relates to the concept of leadership in both a broad and narrow sense. This lecture gives a brief introduction on the concepts and theories of spirituality. Students are guided to reflect on their own spiritual values and how these values can be further developed and embodied in one’s leadership.

Intended Learning Outcomes

After taking this lecture, students should be able to:

7. introduce the definitions, basic concepts, and theories related to spirituality;
8. summarize the antecedents and consequences of spirituality;
9. examine the relationship between spirituality and leadership;
10. explore ways to promote spirituality;
11. appreciate the conceptual and practical issues surrounding spirituality.

Teaching methods

- Lecture
- Video viewing
- Experiential learning activity
- Group discussion
- Meditation
- Self-reflection

Lecture Plan

Part 1: Definitions and theories of spirituality

- Warm-up activity: “The meaning of life”

- Group discussion: “Tuesdays with Morrie”
- Self-reflection activity: “My treasure box”

Part 2: Antecedents and consequences of spirituality

Part 3: Spirituality and leadership: Spiritual practices for leadership success

- Video clip: “A spiritual leader”
- Group discussion: “Spiritual practices of Mandela”

Part 4: Ways to promote spirituality

- Meditation: “Let’s meditate”

Part 5: Conclusion and student reflection

ABSTRACT

Moral competence is an important dimension in healthy adolescent development and effective leadership. In this chapter, a lecture attempting to nurture the moral competence of university students in Hong Kong is described. There are several parts in this lecture. In the first part, moral dilemmas in real life and hypothetical situations are introduced. Second, conceptual frameworks on moral judgment are outlined. In the third part, the relationship between morality and leadership is addressed. In the next part, strategies to promote moral development are discussed. Finally, conclusions and reflections by the students are carried out. In the lecture, students are invited to have personal reflections on their moral competence and integrity in relation to their real life context.

Keywords: moral competence; ethics; moral development; personal reflections; integrity

INTRODUCTION

“Morality” is “*moralis*” in Latin which means customs or manners. In fact, the original meaning of morality is closely related to the term “ethics” which means “character” in Greek “*ethos*”. Perle [1] stated that morality pertains to the individual character of a person, while ethics focuses on the relationships among humans. Modern usage of morality refers to “conduct” itself and ethics (or moral philosophy) is defined as the study of “moral conduct”. Some researchers [2, 3] believed that “morality” is the judgment of our conduct or behavior. In other words, it is as a matter of fact that whether it is right or wrong. For example, it is understood that murder is wrong and honesty is right. Also, “ethics” is a set of principles used to decide what is right or wrong, which are the standards of conduct in different disciplines and institutions. For example, integrity, respect, and social responsibility are listed in the code of ethics. In all, the terms “morality” and “ethics” are closely related to their original meanings and can be used interchangeably [2, 3]. Albrecht [4] stated ten universal values for ethical behavior, including honesty, promise-keeping, accountability, fidelity, responsible citizenship, pursuit of excellence, caring, integrity, fairness, and respect for others.

Philosophers in different cultures have different conceptions about the essence of morality. With specific reference to the Chinese culture, the Confucian idiom of “look at nothing in defiance of ritual, to listen to nothing in defiance of ritual, to speak of nothing in defiance of ritual, never to stir hand or foot in defiance of ritual” (fēilǐwùshì, wùtīng, wùyán, wùdòng) underscores the importance of propriety (lǐ) in the traditional Chinese culture. Confucius also emphasized that the virtues of kindness (rén) and righteousness (yì) as “a superior person” (Junzi). Similarly, Socrates in the Western world also stated that “virtue is not given by money, but that from virtue comes money”. In fact, both the western and eastern moral philosophies illustrate that a moral sage or leader should have self-cultivation and be able to transform others and the social environment [5].

Why morality and ethics are important? First, ethical values serve as the foundation for an orderly society. Besides, Smith, Smith and Mulig [6] suggested that trust instead of greed energizes the economy. Lastly, truly ethical professionals will keep their conduct well above the minimum. In other words, ethics and morality are not only essential to intrapersonal development, they are also the corner stone to healthy social development.

Closely related to the concepts of morality, ethics is the construct of integrity, which means a person’s behavior is consistent with espoused values and that the person is honest and trustworthy [7]. Integrity is the reputation for truthfulness and honesty of the trusted person, which involves an individual’s commitment to principles [8, 9]. As Rand [10] suggested that, integrity means loyalty to rational principles (general truths) and values, and the integration of outward virtuous actions with inner virtuous values. Integrity plays an important role in interpersonal relationship. Without integrity, a person will not be trusted.

CONCEPTUAL FRAMEWORKS FOR MORAL JUDGMENT

Among the different models on morality, the theory proposed by Lawrence Kohlberg is a popular one [11]. According to Kohlberg’s moral judgment competence, the way we make moral decisions in our daily lives is shaped by the socialization process. He proposed a theory

of moral development with three levels. The first level is called “pre-conventional level” which focuses on concrete and physical consequences. The second level is called “conventional level” where moral judgment is guided by social norms. The third level is the “post-conventional level” where morality is determined by universal ethical principles.

All the stages of moral development are related to moral behaviors [11]. Dolgin [12] stated that Kohlberg’s levels and stages of moral development consist of conscious and rational reasoning processes. First, there are two stages in Level I (Pre-conventional Moral Reasoning) which is focusing on oneself. The reasoning starts with “punishment orientation” in Stage 1 and then moves on to “instrumental hedonism orientation” in Stage 2. Upon the completion of Level I, the focus of reasoning will shift from personal to interpersonal in Level II (Conventional Moral Reasoning). On this level, “good boy and nice girl orientation” is evolved in Stage 3 and then moves on to “law and order orientation” in Stage 4. Upon the completion in Level II, the reasoning process goes up the to the last stages of 5 and 6 in Level III (Post-conventional Moral Reasoning). On this level, moral reasoning is further advanced from concerning others to caring about each other. The orientation is changing from “social contract orientation” in Stage 5 to “universal principle orientation” in Stage 6.

Moral dilemmas are commonly used to assess morality in individuals. The most famous one is “Heinz’s dilemma”. In the story, Heinz’s wife was diagnosed to have cancer and there was a newly developed drug that can save her. Unfortunately, Heinz did not have enough money to buy the drug because the druggist was charging much higher than the cost. The questions posed to the students are: what will you do if you were Heinz? Would you steal the drug? Why? In fact, moral dilemma is a good tool to reflect the moral development of a person.

MORALITY AND ADOLESCENT DEVELOPMENT

Adolescents’ level of morality is often discussed in the context of adolescent moral competence. It is defined as “a youth’s ability to assess and respond to the ethical, affective, or social-justice dimensions of a situation” [13]. According to Piaget [14, 15], adolescent moral maturity is indicated by both a respect for rules and a sense of social justice. Morality has long been considered a necessary part of adolescent social competences, which is often linked to their prosocial behaviors and other positive performance [16]. In the Chinese culture that particularly values interpersonal harmony, moral values, and prosocial norms, morality of young people is a topic of high significance [17].

Morality is closely related to adolescent behavior, such as empathy and egocentrism. First, social cognitive theory holds that one’s adoption of values, standards, and attitudes is governed by a much broader and more dynamic social reality. The process of internalizing moral values and principles entails a perspective-taking skill that is necessary for an individual to concentrate on others’ needs instead of one’s own and thus defined as empathetic reaction [18]. Empirical evidence is also available to show that people who make mature moral judgments tend to be empathic and autonomous [19]. Also, from the social-cognitive perspective, human’s long-term goal, such as moral striving, is chronically accessible to a person and guide one’s behavior automatically [20]. Poor development in morality would thus make one to give up ethical rules easily and become susceptible to

unhealthy environmental influences. Hence, adolescents who have lower morality are more likely to develop materialistic thoughts and behaviors in the consumer society today, to concentrate on themselves and to ignore others' interests, given a social culture that increasingly values individualism.

How about morality in university students? Despite the fact that the number of universities throughout the world is increasing, there is a concern regarding the morality of university students. First, research findings showed that narcissism levels have gradually increased over the past 25 years [21], which is an attribute of pre-conventional morality. Second, Loeb [22] observed and conversed with college students across thirty states in the US throughout late 1970s and early 1990s, and noted that they were "pathologically selfish, greedy, apathetic, and unconcerned with higher ideals" (p. 2). Again, these characteristics suggest a pre-conventional morality.

MORALITY AND LEADERSHIP

Brown, Trevino, and Harrison [23] defined that ethical leadership as "...the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision-making" (p. 120). Ethical leaders should consist of the characters such as trustworthiness, fairness, and respect. Also, the influence of ethical leaders would be altruistic, focusing on organizational success rather than their own. Based on these characteristics of ethical leadership, researchers claimed that leaders' influence strategies should be framed actions in ethical terms which can motivate others to follow a shared vision [24, 25].

If leadership is the art of influencing and motivating others to their maximum performance to accomplish any task, objective, or project, then integrity is a critical characteristic of authentic leadership. In other words, a leader will never be able to have the strength to impact others if his/her life is fragmented or lacking wholeness. Moreover, great leadership comes from the identity and integrity of the leader. After all, leaders must always display the highest standards of integrity. Following this line of thought, Smith et al. [6] stated that "what we do determines who we are, and whether we made the world better or worse".

Moral competence is also strongly emphasized in other leadership models. One example is service leadership [26]. According to the Hong Kong Institute of Service Leadership and Management [26], service leadership "is about satisfying needs by consistently providing quality personal service to everyone one comes into contact with, including one's self, others, communities, systems, and environments" (p. 5), whereas a service leader is "an on-the-spot entrepreneur who possesses relevant task competencies and is judged by superiors, peers, subordinates, and followers as having character and exhibiting care in action situations" (p. 5). Besides relevant situational task competencies, moral character and caring disposition are fundamental attributes of an effective service leader.

Another example is servant leadership which emphasizes the importance of moral values and integrity. A servant-leader is a servant first. Servant leadership begins with the natural feeling that one wants to serve, and then conscious choice brings one to aspire to lead. The

servant leader will give priority attention to the needs of their colleagues and those they serve. According to Greenleaf [27], servant leadership is “a model which puts serving others as the number one priority. Servant-leadership emphasizes increased service to others; a holistic approach to work; promoting a sense of community; and the sharing of power in decision-making” (p. 33). Greenleaf upholds the moral values and integrity of being a leader whom should consist of the following moral attributes: listening, empathy, healing, awareness, persuasion, conceptualization, foresight, stewardship, commitment to the growth of people, building community. Joseph and Winston [28] suggested that these ten moral attributes as essential to servant leadership.

WAYS TO PROMOTE MORAL DEVELOPMENT

In order to foster the moral development of students, three practical ways can be introduced. First, students are encouraged to discuss moral dilemmas with others. This can help clarify what the intention and motive are in the reasoning process. Second, students can use dramatic play and role playing to show the authentic cases of real dilemmas. Through role playing, students can deepen their thoughts by having more reflections at different angles. Lastly, self-reflection can be recommended for students to ask themselves before making an ethical decision. During the self-reflection, Smith et al. suggested some questions for ethical decision making [6]: 1) Is it legal? 2) Is it fair? 3) Who would be affected by this? 4) Does it comply with the organization’s values? 5) What will others think of me if they knew about my decision? 6) How will my decision look in the newspaper? 7) How will it make you feel about yourself? Young people should be reminded that when facing moral dilemmas, leaders should focus on “doing the right thing” and that everyone can make a difference in doing the right thing.

CURRICULUM OVERVIEW OF THE LECTURE

Based on the above understanding of morality and ethics, the attribute of moral competence is introduced in the credit-bearing course, entitled “Tomorrow’s Leaders” in The Hong Kong Polytechnic University. This course is being offered to introduce the 14 competences which are essential to leadership based on the positive youth development constructs stated by Catalano et al. [13]. Aligning with the major aims of the course, the lecture about morality construct has the following intended learning outcomes which help students: a) understand the concepts and theories related to morality and integrity; b) identify the antecedents and consequences of morality; c) explain the relationship between morality and leadership; d) generate ways to promote moral development; and e) explain causes of a series of moral dilemmas and related issues.

Corresponding to the intended learning outcomes in developing intrapersonal competence, the curriculum is designed to provide opportunities for students to have substantial personal reflections and integration of personal experience to the theories in their contexts. For example, the concept of integrity is illustrated by contextualizing the term in relation to the issue of academic integrity. Students were being asked to comment on the statement given by

Steven Davis, a psychology professor quoted in *The Wall Street Journal* that “students say cheating in high school is for grades, cheating in college is for a career.” Two common academic dishonesty issues were raised to further support the seriousness of cheating in higher education. Bowers [29] stated that there were over 75% of college students had cheated which were about 5,000 college students. Few decades later, McCabe [30] indicated that there were 50,000 undergraduate students had cheated which was covering 70% of the population in higher education. In addition to cheating, plagiarism is another major issue related to dishonesty. Sheard et al. [31] suggested that it was easy for students to copy and paste from the web to complete their assignments. In fact, research stated that academic dishonesty, especially cheating would lead to deviant behaviors such as substance abuse and illegal behaviors [32, 33]. Moreover, work performance of employees will be affected if they have unethical behaviors or low scores in integrity tests [34, 35].

Apart from reflection exercises, the teaching and learning environment is designed to provide more group discussion time for students to have collaborative learning in comparing with other lectures of similar class size. For example, a group activity, “The Golden Virtues of Confucius” is designed to raise students’ awareness about the qualities or virtues of a leader in the Chinese context. The 13 golden virtues of Confucius are highlighted to students; they are: kindness, righteousness, respectfulness, having a sense of shame, courageousness, incorruptibility, forgiveness, loyalty, trustworthiness, filial piety, brotherly love, self-correction, and wisdom. Each group of students was given a bag of Legos representing the 13 golden virtues of Confucius. Students in the groups were asked to make a model with the Legos given to represent their idea about the golden virtues of Confucius. Their image of the selected virtue(s) was then reflected physically as an object. Students were required to explain about the idea and the meaning of the object in relation to the virtue(s). Group discussion and reflection are embedded in this activity. A brainstorming question was raised to ask students what kinds of qualities or virtues a leader should possess. To debrief, a quote from Dwight D Eisenhower (1890-1969), who was a five-star general in the United States Army and the 34th President of the United States was used to state that, “the supreme quality for leadership is unquestionably integrity. Without it, no real success is possible, no matter whether it is on a football field, in an army, or in an office.”

CONCLUSION

Overall speaking, the lecture content is useful to introduce the conceptual framework of morality with resourceful and convincing information. The linkage between morality and leadership is also stressed to signify the importance of morality as one of the essential competences of leadership. In terms of the teaching effectiveness, collaborating learning strategy enables students participating in group learning. The depth of group discussion depends on the facilitation skills of individual subject teachers. The issue of deep learning can be explored further in future research to enhance the learning experience of students. Furthermore, the successful experience in connection with the development and implementation of positive youth development programs such as the Project P.A.T.H.S. [36, 37] can help to design curriculum materials for university students as well.

ACKNOWLEDGMENTS

The preparation for this paper was financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

APPENDIX 1: LECTURE OUTLINE GIVEN TO STUDENTS

Moral behavior is the result of the interaction between individual (e.g., cognitive moral development, gender, self-esteem) and situational factors (e.g., ethical codes and culture) (Kohlberg, 1981; Rest, 1986). Ethical leadership is an important component for promoting an organizational functioning and maintaining social orders (Smith, Smith, & Mulig, 2005). Ethical leaders can influence the followers' values, beliefs and behaviors by demonstrating normatively appropriate behaviors (Brown, Treviño, & Harrison, 2005). In this lecture, we will discuss the process of moral judgment and moral reasoning, and how students incorporate various effective ethical decision-making methods in their perceptions of ethical dilemmas in the real world. [Dear Dr. Shek, I don't have the lecture outline in hand. Please put the references at the end of the Appendix]

After taking this lecture, students should be able to:

1. understand the concepts and theories related to morality and integrity;
2. identify the antecedents and consequences of morality;
3. explain the relationship between morality and leadership;
4. generate ways to promote moral development;
5. explain causes of a series of moral dilemmas and related issues.

Teaching Methods

- Lecture
- Video Viewing
- Experiential Learning Activity
- Group Discussion
- Self-Reflection

Lecture Plan

Warm-up activity: "What Will You Do?"

- To introduce the lecture topic by presenting several scenarios to the students.

Part 1: Understanding Morality

- Group Discussion: "What Should Heinz Do?"

Part 2: Frameworks for Moral Judgment

Part 3: Morality and Leadership

- Class Activity: “The Golden Virtues of Confucius”

Part 4: Ways to Promote Moral Development

- Video viewing and sharing: “The Story of Star-Fish”

Part 5: Conclusion

Required Reading:

Chapter 165

REFLECTIVE TEACHING AND HOLISTIC PERSONAL DEVELOPMENT

Cecilia M. S. Ma, PhD

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

Research shows that reflective practice plays an important role in promoting teaching performance and facilitating a positive learning atmosphere. This chapter provides a case study on teacher's reflection in a university course. The author discusses the difficulties she encountered and the strategies she used when teaching a leadership course. Students' post-lecture qualitative evaluation is used as illustration to show how these feedbacks guide the teacher when reflecting and evaluating her teaching performance. Implications are discussed to highlight the importance of reflective practice in university contexts.

INTRODUCTION

In the field of teacher education, reflective practice refers to the involvement of questioning individuals' assumptions, values and beliefs of teaching [1]. Given the increased popularity on student-centeredness in education, teachers no longer just feed the students. They need to strengthen their role as learners to foster a meaningful development for themselves. Indeed, reflection is critical for teachers' learning and development [2]. It highlights the importance on learning through critically examining and questioning on their own performance [3]. It is also known as experiential learning process, which involves four stages of learning: concrete experience, reflective observation, abstract conceptualization and active experimentation [4].

Through this cycle, effective learners are able to 1) use their experience to identify problem, 2) review and reflect on the experience, 3) transform the experience into new idea and new concept and 4) engage in new behavior to test the hypothesis. Once this cycle is

completed, another cycle begins. In general, professional development is a continuous learning process [5]. Teachers “collect data about their teaching, examine their attitudes, beliefs, assumptions, and teaching practices, and use the information obtained as a basis for critical reflection about teaching” [6]. This method is considered as a way to promote professional development [7] and has been used in various areas of teaching, such as classroom format and teaching context [8-10]. However, little is known in the university context, particularly when teaching a holistic education course.

Universities have been suggested to help students better prepare themselves when they enter to the society. During college, students need to make a lot of important decisions and to face changes in various aspects of life, such as family, friends, intimate relationship and career. “It is a time of ‘soul searching’ where students actively develop a sense of who they are, who they want to be and what roles they will play in life” [11]. Apart from nurturing intellectual ability and knowledge, a broader development of human and education performance, including critical thinking, content and process is suggested. Recently, a holistic education approach receives increasingly attention regarding its nature and importance [12, 13].

“Holistic education incorporates the insights, knowledge, and skills necessary for ‘learning how to learn’ as a lifelong process” [14]. “To nurture our students to be critical thinkers, effective communicators, innovative problem solvers, lifelong learners and ethical leaders”, The Hong Kong Polytechnic University developed a 3-credit bearing course titled “Tomorrow’s Leaders.” This course aims at promoting students’ intra- and inter-personal qualities of effective leadership and developing self-reflection skills in their daily lives. Previous results generally showed the positive development of psychosocial competencies among students after enrolling in this course [15-19]. However, prior studies in the field of holistic education mainly focus on students’ perception; little is known from teachers’ perspective. For example, what were the barriers and effective strategies when teaching a course on holistic personal development? The purpose of this article is to provide a case study on teacher reflection in a university course. In this paper, I share my experience when teaching a holistic leadership course. Some examples included a) what were the difficulties I faced when teaching this course; b) what strategies I used when facing these difficulties; and c) how effective of these strategies in addressing the aforementioned problems. Students’ post-lecture qualitative evaluation was used as illustration to show how these feedbacks guide teacher in reflecting and improving her performance when teaching the course.

COURSE DESCRIPTION

All full-time students from multidiscipline (e.g., humanities, engineering, health care professional, sciences, social sciences, and design) were required to take a 3-credit bearing course titled “Tomorrow’s Leaders” in their freshman year. Students met three hours a week for 14 weeks (a total 42 hours). At the end of each lecture, students are asked to complete a subjective outcome evaluation form including 12 items and one open-ended question regarding the content and process of the lecture [details in Shek, 15]. In the present paper, focus was put on the findings based on the qualitative data (i.e., an open-ended question).

Teacher's Background

Being a coach and teacher for more than 10 years, I love working with adolescents and young people and like getting in touch with students. I often think they have a lot of potentials. What they need is how we, as an active social agent, provide opportunities for them to find their identity, to reach their goal and to experience their full potential. I hope I can help them become their best. These beliefs are aligned with the rationale of the course "Tomorrow's Leaders". This course adopts a positive youth development approach, which focuses on nurturing what is the best in individual's life and developing individuals' strengths [20]. It is a place to help the college students to be well prepared, search for identity and pursue their personal growth goal. It is my hope that students can achieve optimal functioning and develop a strong sense of direction before they enter the next step in their adult life. When teaching this course, students' needs and learning processes are my major concerns. However, these concerns might not be easily addressed due to the following challenges:

Traditional Passive Learning Behavior

When I knew I was assigned to teach "Tomorrow's Leaders," I felt quite nervous. On one hand, unlike other discipline-based courses, this course is focused on personal growth and development, which is quite different from what I used to teach. Perceiving myself as the change agent, I began to question my teaching, seek alternatives to meet the students' needs and engage in systematic reflection about my teaching. On the other hand, I perceived this as a great experience to understand and empower our students. I asked myself a series of questions: *"What do I want my students to learn?"*, *"How to raise their awareness of their inner self and to transform their knowledge into different contexts?"*

In particular, the biggest challenge was how to motivate students to actively engage in the class. Hong Kong Chinese students were used to sit in the classroom, take notes, and answer questions as teacher requested. In general, under this "spoon-fed" learning environment, they were very passive in classrooms. For me, this is the greatest challenge to elicit their active involvement and participation, which is essential for holistic education [21]. Furthermore, students, especially freshmen, might suffer from stress and anxiety. They need time to adapt, to search a new identity, and to achieve a successful integration into the new one when facing the transition from high school to college [22]. This is also reflected from the qualitative lecture evaluation:

"The teaching method is totally different from that in secondary school and I really need more time to get used to it..."

"Have a good chance to interact with my classmates from diverse cultural backgrounds! A new experience."

Multitasking and Media Saturated World

Another challenge was how to maintain students' attention in a media saturated world. Nowadays, multitasking is becoming more common in our young generation. They are grown up in a highly-connected world and are immersed in digital stimuli. They are glued to various digital devices, such as laptop, tablets and smartphone. Studies show that the use of these digital technology hampered university students' attention to focus and comprehend complex concepts [23, 24]. In particular, university students are not good at time management. Very often, they suffer from sleep deprivation, problem of concentration, irritable moods, poor diet and unhealthy lifestyle [25, 26]. With the increased availability of new portable digital technologies, it is very difficult for them to concentrate in a class, especially for a three-hour lecture. It is not uncommon that students engage in active texting, sending email or surfing the internet during class. Facing this ubiquity of digital technology, I asked myself "*How to deal with this problem?*", "*How to keep my students focus on the class and less distracted by their digital devices?*"

Abstract-Oriented Holistic Education

During class, I observed students, especially from science and engineering disciplines, expressed their difficulties in understanding the qualities of effective leadership. In fact, this perhaps relates to an abstract conceptualization nature of holistic education [14]. When examining the effectiveness of holistic education, Benander and Lightner [27] noted that students might not be able to recall what they had just learned, to transform the abstract conceptualization into a meaningful way, and to apply this holistic knowledge later in other contexts. Therefore, more real-life stories and concrete examples would be helpful for students' to understand the lecture materials. This is reflected from the qualitative lecture evaluation:

"Can have more inspirational and life stories of the influential leaders e.g., Barack Obama, Steve Jobs, etc. This would help us better understand the theory."

"Teacher can share her own experience with us."

"Lecturers can share their personal past experiences."

Regarding to the aforementioned challenges, I reflected my previous teaching experiences, searched for alternatives, and tried trying out new strategies to meet the students' needs and the course goals.

Strategies

To help students develop a sense of belonging and elicit their participation in the new learning environment, several methods, such as calling students' names, adopting their ideas, telling jokes, joining the group discussions and praising desired behavior, were used. These strategies not only provide a safe and welcoming learning atmosphere, but also motivate

students to participate and share their thoughts in the class [28]. As reflected from the qualitative lecture evaluation:

“Today’s lecture is surrounded by a very comfortable and positive atmosphere. I enjoy the exchanges I had with my group mates. Things are getting better around me.”

This friendly and relaxed learning environment ensures productive sessions by encouraging students to interact with others and build their confidence [29].

“In this lecture, I achieved my first goal. That is, I volunteered to answer the question in front of the whole class. Next time, I’ll try to be more active when interacting with the international students. It might not be easy, but I will try.”

“Thank you for remembering my name! Every time I participate in the class, I receive positive energy and have a clear sense of direction.”

Use of Cooperative Teaching Strategies

Another way to elicit students’ active participation was to provide a cooperative learning context. Cooperative learning is considered as essential part of the collegial experience [30]. Under the cooperative learning atmosphere, students were asked to respect others’ views, work together to create new ideas, take an active role for their learning, and thereby enriching learning process [31].

During the first week of the semester, students were divided into small groups (6-8 students per group) and were assigned with different roles (i.e., leader, coordinator, time keeper, recorder and reporter) in order to promote their function in leading small groups. They were asked to complete a task, to share and to reflect their thoughts with their neighbors or on their own. Sometimes, they were invited to report their views in the class. This is particularly effective when class size is large (above 80 students).

Similar to the findings in the field of cooperative learning research [14, 31, 32], this approach deepens students’ learning process by giving them an opportunity to review what they just learned and discussed with their classmates in small groups. It also motivates students to work together and realize the importance of intergroup relations. They are encouraged to work in a mixed-ability group, to learn the importance of interdependence and to foster an appreciation for differences in terms of ability, race, and background. This learning approach allows students to become more active in learning by cultivating students’ mental openness, taking responsibility of their own learning and appreciating the influence of others on shaping their personal growth [31] and this is aligned with the objectives of the course [16]. This is reflected in the post-lecture qualitative evaluation.

“From this lesson. I make friends from different cultural backgrounds.”

“It’s really nice to divide us into small groups. It provides us a good chance to build our friendship.”

“The class activities give us an opportunity to communicate with group members.”

“The games are very funny. I enjoy interacting with my group mates!”

“I really like the games in this lesson. I learn the cooperation skills.”

“The class activity enhances our communication and teamwork skills.”

Furthermore, by using the clarification pauses technique, the lecture was divided into several mini-lectures (around 20-25 minutes) [33]. As suggested by Hamer [9], this mini-lecture keeps students actively engaging in the class. This is especially important as nowadays the average of attention span of students is generally short and often distracted by the ubiquity of digital technology. This is also reflected from the qualitative lecture evaluation:

“Two breaks are good; it makes us stay awake in class.”
 “It is a good idea to have short breaks.”

The Use of Self-Disclosure

To help students transform the knowledge and apply it into other contexts, an effective instructional tool—self-disclosure was used. Self-disclosure refers to “the act of making yourself manifest, showing yourself so others can perceived you” [34]. This process focuses on facilitating students’ learning by making one’s own and other’s experiences meaningful [3]. For me, each lecture provides a good opportunity to review my life experiences and explores ways to enrich the course materials. Similar to the findings in self-disclosure research, students perceived the teacher positively by incorporating social and affective elements in the students-teachers relationship [32, 35, 36]. After listening to my unique stories and experience (e.g., the failure in public examination, an identity crisis story in my freshman year of university), students perceived their teacher to be friendly and approachable. This reduces the distance of teacher-student relationship and fosters the establishment of a warm and supportive environment [37], thereby enhancing students’ understanding of the teaching materials [38-40]. The above influences are reflected in the qualitative post lecture evaluation:

“A very important lecture. Your personal experience is important. It let us know that we are not alone.”
 “It is great to hear the lecturer’s own story because it is so real and encouraging.”
 “Your sharing is very important as it helps us better understand the topic. Every lesson is a chance to build a relationship with you. Enjoy your lesson!”
 “I really love to listen to your sharing...just like listening some meaningful stories. I enjoy this lesson very much!”

GENERAL OUTCOMES ON STUDENTS LEARNING

By using the above strategies, students’ learning process was enhanced by raising their self-awareness. For example, through the in-class self-reflection exercises, students were encouraged to reflect their thoughts and to take an active role in constructing their understanding. They become more self-aware by evaluating their strengths and weaknesses. This is aligned with the holistic education by assisting students to develop a reflection practice as a life-long process [41]. This is reflected from the qualitative evaluation:

“This lesson helps me reflect on my own values and find meaning in my life.”
 “I know more about my personality. I need to be more active and less fear to express myself openly.”
 “Every lesson is a good chance to know more about myself. It encourages me to face my future. I want to achieve something after graduation.”
 “I learnt something new today. The lecturer told us that there is no reason that we put ourselves down. I should be more confident.”

Encouraging Students to Reflect on Their Own Experience and Promote Their Profession Development

Through the cooperative learning, students were asked to work together and held accountable for their learning. This promotes cognitive changes in their thinking and learning [32]. Furthermore, through the use of teachers' self-disclosure, the process of transforming abstract conceptualization ideas into a concrete experience was improved. Students were able to perceive the connection between the lectures and real-life experiences and to apply the knowledge in other contexts. They were motivated to reflect on their own strength and weakness and to achieve personal goals in the future. This is reflected from the qualitative evaluation:

"It is a meaningful lecture as it gives us a chance to reflect on our emotions. Emotion management is very important but people often ignore it in our daily lives."

"Today, I learnt some emotional management skills, which are essential in my career."

"After this lesson, I learnt that controlling bad temper is really important. I decided to write my own journal to capture my emotion. I hope I can see sunshine every day."

"I love the part that you share your own story. It is interesting and inspiring. I believe that everyone is special and his/her story is unique. Listening is an important skill in hospitality industry. And it is my interest."

"The reflective activity helps me to recall my past experiences, which makes me have a clear view about my life in the future."

The above qualitative evaluation states showed the cognitive changes in the process of learning, which is important to the development of higher-order of thinking [42]. Students were encouraged to connect the lecture materials to their past personal experience or major life events related turning points in their life. They became more actively reflect on their own learning experience and focused on their personal and profession development. They were able to make the content they learned in the class in a meaningful way and to use it later in other contexts.

BENEFITS TO THE TEACHER

In the field of teacher education, there is an increasingly emphasis on the integration of teaching and reflection in practice. Through this continuous self-evaluation process, I reconstruct my teaching practice and searched for new solutions to meet the needs of the students [43]. I deliberately searched for a mindful solution once problem is identified, thereby leading to ongoing and deeper understanding of teaching [44]. It involves self-directed thinking and ongoing critical inquiry of my practice and helps me better understand how my thinking, beliefs and values affect my behaviors [45].

As noted by Loughran [10], both "seeing" and "action" are essential elements of effective reflective practice. Using my experience, intuition and values during teaching, I tried out new strategies relating to my profession and reflecting upon students learning processes [46, 47]. I became more sensitive to students' response and searched for solutions and other instruction tools to meet their needs and to promote their learning.

"When self-disclosing, gathering feedback from your students is one way to gauge the effectiveness of the amount you disclose" [29]. When reading their post-lecture evaluation

feedbacks, I gained feelings of social intimacy from the students. It ensures my disclosure is well received and suitable to the lecture topics. It also helps me reduce anxiety and uncertainty about the appropriateness of my self-disclosure. It also provides a trust environment for the students to disclose themselves through the written feedbacks [39]. This motivates me to search for another new solution to address this new facing problem.

This reflective practice encourages me to reflect upon my previous experiences in order to improve my teaching. This method is also used during out-of-class communication (e.g., chatting with teachers after class). It provides me another effective instructional tool to produce a positive learning environment that is conducive to student and teacher learning. This supports the notion of the inclusion of social and affective development between students and between teachers and students through cooperative learning [14, 31, 32].

CONCLUSION

With the overemphasis on academic and vocational training, more effort is needed to promote the personal development and learning [48]. Holistic-oriented course is important to nurture an individuals' potential in terms of the cultural, moral, spiritual and interpersonal aspects of their lives. Under this learning atmosphere, students are asked to take an active role and engage in the learning process in order to expand the concepts in an interactive and creative manner [49]. They are asked to integrate what they learned in the class to real-life situation and apply to everyday life. This experiential practice challenges traditional educational practices, which rely heavily on lecture as the only method of class instruction, and deepens students' learning by building the connectedness of materials and transforming later in other contexts to other various aspects including moral, social, emotional, and physical of learning [27, 31].

With the assumption of lecturing equals learning [50], the traditional lecture format, which is characterized by students' passive note-taking behavior, challenges my view of teaching by encouraging me to reframe and seek alternative ways of approach to my teaching practice. It enhances a greater sense of understanding of the given situation by reshaping my approach on teaching practice. I become more willing to listen to other's opinions and views, to take responsibility to change and to explore ways to meet students' needs. These changes improve the development of my attitudes and profession [51].

In line with Farrell [43], through the reflective teaching, I continuously recalled and evaluated my teaching experiences in order to improve my performance in the future. As reflective practitioner, effective teachers emphasis on improving teaching through questioning and evaluating their teaching practice. The importance of reflective teaching has been examined, particularly with the emphasis on student learning outcomes [52]. Little is known its beneficial effects on teachers. The present study provides a case study on demonstrating how a teacher utilizing reflective capabilities (e.g., identifying problems, gathering information, searching and experimenting solutions) when teaching a holistic leadership program. It highlights the role of reflective practice on teacher professional development.

Chapter 166

REFLECTION OF A TEACHER

Lu Yu*, PhD

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

“Tomorrow’s leaders” is a general education subject aiming at promoting holistic development of undergraduate students in The Hong Kong Polytechnic University. In this chapter, the author presents her views and reflections on teaching this subject during a two years period. Successful experiences and lessons learned in terms of the curriculum design, ways of building relationship with students, and the application of experiential learning in this subject were shared. It is highlighted that teacher’s reflective practices are fundamental for promoting students’ effective learning and teacher’s personal development.

INTRODUCTION

For a two years period, I have been teaching a leadership subject, “Tomorrow’s leaders,” for first-year undergraduate students at The Hong Kong Polytechnic University. As a general education subject, “Tomorrow’s leaders” attempts to promote leadership and intrapersonal competencies in university students in Hong Kong [1]. While this subject was piloted twice and multiple evaluative strategies have suggested its desirable learning outcomes in terms of the holistic development of university students [2-7], it puts a few challenges to me. First of all, starting from 2012/13 school year, “Tomorrow’s Leaders” became a compulsory course. All freshmen at The Hong Kong Polytechnic University are required to take this subject, which, like other compulsory subjects, inevitably results in reluctance in the students to attend the course, particularly for those who major in “hard science.” Second, this subject is featured by the incorporation of various class activities based on the theory of experiential learning.

* Corresponding Author’s Email: lu.yu@polyu.edu.hk.

Students are provided with different opportunities to understand, practice and reflect on the knowledge and skills learned in lectures. It is very important for the teachers to find out methods to actively engage students in these activities so as to have desirable learning outcomes. Third, the aim of the subject is to promote students' all-round development in different domains of one's life which makes one's in-depth personal reflection a precondition to learn well in this subject. This is quite different from the subjects I taught before. Basically, self-reflection is the capacity to introspect originated from the willingness to learn more about oneself. How could I force the students to reflect on themselves if they do not have strong self-motivation? At that time, all these challenges created much anxiety in me.

The teaching period passed quickly and I found myself growing with my students in the process of teaching this subject. It does not only promote the development of my students, but help me to become a more mature and reflective teacher. In this chapter, I would like to share a few experiences and reflections in three aspects in my teaching, curriculum of the subject, building relationship with students, and the application of experiential learning. With these reflections, my understanding about teaching has been deepened and meanwhile I gained more confidence in my abilities as a teacher.

CURRICULUM OF THE SUBJECT

The primary objectives of the subject "Tomorrow's leaders" are to train students to develop and reflect on their intra-personal and interpersonal qualities and promote students' active pursuit of knowledge for becoming a responsible and contributing citizen [1]. Guided by these objectives, an integrated curriculum was designed which comprised 12 interrelated topics focusing on different aspects of positive development in university students, including self-understanding and personality, cognitive competence, emotional competence, resilience, spirituality, morality, positive and healthy identity, social competence, interpersonal communication and conflict management, relationship building and team building, mental health, and self-leadership. Utilizing various evaluation strategies including objective outcome evaluation, subjective outcome evaluation, qualitative evaluation and process evaluation, it was found that the subject was able to promote the holistic development of university students in Hong Kong and that students generally like this subject and have positive perceptions about the curriculum [2-8]. These findings suggest that overall the curriculum is successful in arousing students' interests and helping to achieve the learning objectives of the subject.

While I was teaching "Tomorrow's leaders," one of my observations was that students were quite attentive and participative in most classes but once in a while some students showed boredom and uninvolved. Apart from students' personal reasons (e.g., physical discomfort, tiredness, etc.), one factor that may lead to this phenomenon is that the teacher failed to make meaningful connections between the curriculum and students' lives.

Students are always attracted by cases and examples that are directly related to their own lives. Like Peterson stated [9], "a teacher cannot build a community of learners unless the voices and lives of the students are an integral part of the curriculum." (p. 30). One of the most welcomed topics in this subject is "social competence" and the related lecture really links the topic to the lives of university students well. After an introduction about a theoretical

model of social competence (i.e., three basic components of social competence), a real case was shared with students about a master's degree holder who failed to find a job in three years after graduation from a famous university in Hong Kong. Students watched a video clip and then were asked to discuss the reasons why this person with high IQ could not secure a job using the model learned in the lecture. They were also encouraged to reflect on themselves in terms of their own social competence. Students showed strong interests in this case as it is so close to their present lives. They might have to face the same problem when they graduate. The group discussion on this topic was very hot and many students were able to analyze the case from different perspectives. They also reflected that they became more aware of the importance of one's social competence than before. Some shared that they shall try the methods learned in this subject to develop their own social competence in daily lives. As such, this case study successfully helped students understand the concept of social competence, its importance, and promoted students' active pursuit of knowledge.

Another experience is about teaching the lecture on spirituality. At first, the concept of spirituality was introduced in terms of its key elements, i.e., connectedness, personal beliefs and values, and meaning of life. Many examples were given to facilitate students' understanding about each element of spirituality and the teacher also shared her own spirituality in different aspects. However, students still appeared to be confused and bored about this topic as it seemed to be too far away from their lives. Quite a few students had never thought about these "philosophical questions," such as "the meaning of life." I have to confess that in the first semester teaching this topic was a "disaster": students looked sleepy, tired, and non-responsive though I'd tried all means to "warm them up." I was also exhausted after the teaching. This experience motivated me to ponder: in what way could I concretize this abstract concept and make it more relevant to students' lives? Working together, my colleagues and I designed a new activity called "an auction of dreams" by which we attempted to illustrate the concept of spirituality in an easy-to-understand way and also give students time to reflect. In this activity, students were provided with opportunities to bid for one or more dreams from a series of ten items (e.g., "a flat," "a stable job," "an outstanding talent," and "a position in the Government that can influence the education policies," etc.) with a limited number of "magic bars." They were first asked to choose three dreams they wanted to achieve most and list the reasons. When the auction game started, students bid for their favorite dreams and the person who gave the highest price (most magic bars) would get the dream. As the quota for each item is limited, students have to strategize about how they can successfully get the item. After the auction, several reflective questions would be further proposed for students. For example, "what are the things that you value the most in your real life and why are they important," "how do you invest for your dreams," "are you satisfied with the dreams you've got? Why and why not," etc. By reflecting on these questions, students realized that there is always something they value behind their dreams; it could be the connectedness with people or the high being; it could be the meaning and purposes of one's life, or one's personal beliefs, etc. And all these constitute one's spirituality. In this way, students obtained a better understanding about the topic and also a deeper self-understanding.

In addition to making the curriculum relevant to students' lives, more efforts could be made in connecting the subject content to the current world. Showing students the relevance of what they have learned in the subject to the society broadens students' horizon and further motivates them to pursuit and apply the knowledge. This shall also be the responsibility of a

teacher. In my classes, I found that students are particularly interested in discussion on current social issues in Hong Kong and the International society as well. For example, in teaching morality and ethics, we had a fierce group debate on a classic case of moral dilemma, Heinz's story, in which students showed great participation. Despite of this, students expressed that although the lecture was very intriguing, they wish to have more discussion on controversial issues that currently exist in our society, for example, the genetically modified food. I tried to bring this topic for group discussion in another class and not surprisingly students demonstrated diverse perspectives based on their understanding of morality and ethics; they also shared that they really enjoyed the discussion and have more interests to self-study morality and ethical issues. In fact, every topic of "Tomorrow's Leaders" could be readily connected to the current world and university students' lives. Teachers shall strive to make such connections as much as possible, and this will greatly contribute to effective teaching and learning.

BUILD RELATIONSHIPS WITH STUDENTS

The importance of positive teacher-student relationship for students' academic achievement and personal development has been stressed in numerous studies [10-13]. Researchers suggested that teachers who have personal involvement with students show them that they are respected, valued and cared [14, 15]. These feelings motivate and engage students toward improved academic performance and positive development [16, 17]. According to Payne [18], most children do not fail because of their cognitive abilities but because they feel unwelcome, detached, or alienated from significant others in the educational environment. The relationship between a teacher and a student serves as the foundation for the student's learning and largely determines the student's successes or failures in the subject. There is no exception in teaching "Tomorrow's Leaders" although we are facing "successful" and "mature" university students. In my classes, students appeared to more willing or happier to learn, to share, and to express different opinions when they felt comfortable and safe in the learning environment, which depends largely on a good teacher-student relationship.

Get to Know Students

Getting to know students is the first step for building positive teacher-student relationship. From the beginning of a semester, I try to remember every student's name. Calling a student by his or her name gives the student the feelings of being valued and important. Like one student from the Department of Physiotherapy shared:

"What impressed me most is that the teacher could remember all of our names which I did not think any university lecturer is able to do so. This makes me feel respected and pleased when she is able to call my name... Attending lectures of 'Tomorrow's Leaders' therefore becomes one of the things I look forward to every week."

However, it is not easy to recognize every face in the classroom especially when you have several classes with each consisted of more than 60 students. There is one activity which

I found helpful. Usually in the first lecture, I asked every student to write down three words to describe oneself (such as a hobby, one's appearance, or personality traits). Then students would take a group picture in which one must show at least one characteristic that he or she just described him/herself. In a self-introduction session, students would introduce to their group members how this picture showed one's unique characteristic(s). A group coordinator would then send me their group photo with all members' names as well as their respective descriptors being marked out on the picture. With these materials and a few times of practices in class, I would be able to recognize every face of my students and also create a short student information sheet which tells me at least one aspect of each student. In the following lectures, I would try to talk to different students as much as possible. Every time when we have self-reflection exercises, or individual work, I would add the materials to the information sheet. These exercises help me gradually know my students and develop interests in their individual lives.

Show Care and Respect to Every Student

Simply knowing students is not enough. What's more important for teachers to build a true bond with students is to show them care and respect [19]. In my own teaching, I also found that it was not until I genuinely show my care and concerns to the students that they started to trust and depend on me. Interestingly, when students feel the care and respect from the teacher, they also learn to respect and care about each other. This, to a large extent, contributes to cultivating a secure and positive learning environment where students are comfortable to answer or ask questions, to participate in various activities, to share their views and feelings in front of the whole class without being worried about that someone may laugh at them. The mutual respect between students and the teacher also serves as a foundation for good classroom management. Students would more readily accept disciplinary actions when they violate the classroom rules, for example, the deduction of participation score due to lateness or absence. Like Jones put it [20], "if the students like you, they will go along with almost anything" (p. 191).

Admittedly, every teacher has challenging students in class, who are more difficult to make connection with. In teaching "Tomorrow's Leaders," one problem that I have to face is that some students are "required" to take this compulsory subject although they have no personal interests. Most of them would show passive aggression, for example, come late for class; keep silent in group discussion; do other assignments in lecture time, and take a casual attitude towards class activities, etc. These students' behaviors usually change after a few lectures, when they start to experience the benefits of the subject, such as a friendly atmosphere of learning, the care of the teacher, interesting knowledge that can be readily applied in their daily lives. However, there may still be a small number of students who remain the same, if not worse. Even I have gone out of my way to show the students that they are liked and valued; it seems that they just don't buy it, which made me really frustrated. For many times, I asked myself whether I had done anything wrong with the students; where my problem was; why these students didn't recognize my efforts and hard work; how I could make the students like me, etc. The obsession with these self-doubt questions and the negative feelings disturbed my teaching by slowing down the pace of the whole class, shifting my

attention away from the majority, and so forth. At the same time, the grudges I hold prevented me from developing truly positive relationships with the challenging students.

In my reflection, I was inspired by Tauber [21] who pointed out that teachers shall not take a student's negative behaviors personally because the problem is with the student, not the teacher. This is a good reminder for me. Instead of focusing on finding faults in my teaching, I shall make more efforts to understand the students. I found that when I dropped all grudges, took a personal interest in the students and genuinely cared about them despite their inappropriate behaviors, the connections between the students and me were gradually established. They started to show a less negative view towards the subject and become more and more participative in lectures. Meanwhile, the established connections with the teacher and other students supported the challenging students to reflect on their past experiences as well as their current behavioral patterns. Like one student from Faculty of Engineering shared in his reflection,

"To be honest, when I first enrolled in this course, I hate it...I really didn't think that the lectures are useful for me or my career...it's just a waste of time... my views gradually changed as time passed by...the teacher is very caring and patient to all students...though sometimes my behaviors may disappoint her, she always forgive me...after today's lecture, for the first time I started to think about the person who I really am... my arrogance...my relationships with others..."

Borba [22] said that people "all need to feel a sense of connectedness to another human being—particularly to those whom we consider to be important and significant" (p. 163). In classroom, teacher-student relationship can make the greatest difference. It is gratifying to see this miracle happens in my class.

EXPERIENTIAL LEARNING

Experiential learning represents a pioneering pedagogical approach based on the central principle that people learn knowledge by constructing the knowledge themselves [23]. It is believed that if the students do not participate in an active learning process, i.e., their brains do not process the things that their teachers delivered, the learning results would be limited [24]. In "Tomorrow's Leaders," a highly interactive teaching and learning methodology is adopted to facilitate students' experiential learning. For every lecture, various types of games and activities were incorporated into the curriculum. There are video watching and discussion, news sharing, self-reflective writing, team debates, role plays, group projects such as collage and poster making, as well as individual and group presentations. Students are provided with abundant opportunities to discuss and report their views toward various issues, to role play different scenarios, and to reflect on and share one's feelings and experiences. For example, in the lecture about resilience, a video clip of Steve Jobs' speech at Stanford University was played in which three stories about Jobs were told. Students were asked to pick up their favorite story and explain what insights about resilience they obtained from the story that can be applied to their current lives. A few students would be invited to share their opinions in class. In such an activity, students have to link the concept of resilience to the experiences of Steve Jobs based on their own understanding and actively explore the importance of resilience to their own lives. They also have to organize these views and reflections in order to give a short presentation. As such, students construct the knowledge by

themselves instead of passively receiving the information from the teacher or the lecture notes. This has also trained students' critical thinking, effective communication, and problem solving abilities, all of which are regarded ideal attributes of university graduates [25].

Motivate Students' Participation with Praise and Support

Unquestionably, this highly interactive teaching and learning approach requires students' active participation, while for first-year undergraduate students, particularly those who just graduated from secondary schools where the medium of instruction is Chinese, speaking in front of the whole class in English is intimidating, not to mention discussing or sharing one's inner feelings. In my own teaching, students' participation has been greatly improved by providing them enough praise and unconditional support.

Recognizing student's effort in learning is one effective way to improve students' motivation to learn [26]. When students failed to perform well, support from the teacher motivates them to keep trying without being defeated; while if students perform well the teacher's sincere praises encourage their further learning. In my class, it is not uncommon to see that students cannot express clearly about their opinions when answering a question or reporting the results of group discussion. Providing timely assistance (e.g., further clarify the students' points of view) is important to support the students to complete the task successfully. This also helps regain other students' attention. One of my common practices is to always highlight a few good points in the students' performance and invite other students to give the presenters a big hand. This communicates the teacher's confidence in the presenting students' ability and also nurtures a culture of mutual-respect and appreciation in the classroom. Following this further, after every lesson, I would write an email to the whole class to summarize the content of the lecture, appreciate the participation of every student, highlight the performance of a few students/groups, and invite them to ask questions related to the topic. This practice further enhances the teacher's recognition for students' active participation and helps to maintain a good teacher-student relationship.

Another reflection on inviting students' participation in class activities is that all students shall be called on impartially. Often, we tend to call on a small number of students who are active and responsive while allow few chances for students whom we have low expectation for. This may cause some students lose self-confidence in their ability and interests in the subject because they believe that the teacher doesn't expect them to be able to answer the questions or perform well. To monitor myself in providing all students with equal opportunities, I often put a check on the name of the student or group I call on during class discussion. Such a record helps me to notice those students whom I gave less attention to so that I will call on them in the next discussion. Over time, some passive students in my class actually become active students, like one student from Broad Discipline of Computing shared with me in her email,

"For many students like me, we are so afraid of speaking in front of many people. We feel scared that we would say some inappropriate words or make funny mistakes and be laughed at by others...I used to keep silent in class or avoid eye contact with the teacher when she invites students to answer questions. However, in Tomorrow's Leaders' class, every student has a lot of chances to talk in front of the class...when I have the chance to speak...I can practice more...and I build up my self-confidence when the teacher and my classmates applauded for me. I found myself less scared and more enjoyed about representing my group to report in class."

Teachers' Self-Disclosure

The role of the teacher is no longer the knowledge transmitter but the facilitator in experiential learning [27]. While the topics taught in “Tomorrow’s Leaders” are all interpersonal and intra-personal qualities which everyone encounters almost every day, the teacher’s self-disclosure can go a long way facilitate students’ learning. By talking about oneself and sharing personal feelings and beliefs, the teacher demonstrates how he or she understands a particular issue and how personal insights could be gained from reflective practices.

In my own teaching, I found self-disclosure a powerful tool, when used appropriately. It deepens students’ understanding, increases their trust in the teacher, motivates them to share more about themselves and take a more active and serious attitude towards learning. Many students expressed that the clarity of the knowledge points is improved when I use personal experiences as examples. For instance, while I was teaching Marcia’s identity development theory [28], I shared with students how I achieved my own identity as a student majoring in psychology using the model: how I explored different possibilities in regard to my career when I was a undergraduate and finally make my commitment. Students felt much easier to understand the theory after listening to my case. They were also more readily to apply the theory in analyzing the process of their own identity formation and find out their problems which shall be further resolved. Sometimes I am not just disclosing myself, but talking about my family, experiences of previous students, my friends, their lives and personal problems. The various topics increase students’ interests and motivation. Many times after my self-disclosure, students shared that they gained insights about their own lives and wished to have more such cases in other lectures, like one of my students from the Institute of Textiles and Clothing wrote in her reflection:

“I really appreciate the teacher’s sharing about her own experiences and the stories of her previous students. This helped me to understand the topic well and gave me the courage to reflect on myself...Knowing that I am not the only person who has the struggles makes me feel less lonely...it’s fine to have problems and to make mistakes... I wish to hear more such stories in the next lecture.”

On the other hand, when teacher’s self-disclosure is not well planned / prepared, it may not be effective in facilitating students’ learning, and sometimes may cause negative perceptions of the teacher by students. In teaching the lecture “emotional competence,” we designed an activity called “life line,” in which students were invited to recall their memories on one happiest and one saddest events in the past and reflect on how these events affected their present lives. To demonstrate how this activity can be conducted, I shared one of my saddest experiences, the passing away of my grandma. Without being fully prepared, I burst into tears in front of the whole class while talking about this traumatic event and it took me quite a while to recover and continue the lesson. This obviously affected students’ participation in the activity because their attention was shifted from the activity to the teacher’s emotion. One lesson obtained from this experience is that teachers shall consider to what degree and how much personal experiences they can disclose to students when preparing for class. Although a teacher’s self-disclosure could be a very effective method to facilitate students’ experiential learning, we should do this appropriately with good preparation.

CONCLUSION

The experience in teaching “Tomorrow’s Leaders” has also changed me both as a teacher, and as a person. First and foremost, my views about teaching have been transformed. Trained in traditional teacher-centered educational environment, I used to believe that a good teacher’s job is to clearly disseminate knowledge and students have the responsibilities to absorb the knowledge if I have done my job. I was able to deliver a lecture with clarity, explain a concept/theory with many examples, answer students’ questions effectively, but I didn’t have much know-how on students’ active learning and teacher-student interaction. With the well-designed interactive curriculum of the subject, frequent discussions with colleagues, constant practices of different methods, and most importantly, many times of reflections on my teaching in each lecture, I have gradually understood the essence of student-centered approach to teaching and learning, i.e., to “produce learning through student discovery and construction of knowledge” [29]. In this process, I’ve also learned a few methods to actively interact with my students; for instance, using different types of questions (e.g., survey the class, rhetorical questions, brainstorming, etc.) to stimulate students’ thinking and interest. By shifting the focus from teacher’s teaching to learner’ learning and taking into account each student’s interest and individual style, the teacher can actively involve students in the learning process and desirable learning outcomes can be then achieved.

Secondly, reflection on teaching the subject deepened my self-understanding and made me a more mature person. One insight I have gained is about my fear for interactive teaching. In the beginning of the first semester when I taught this subject, I had a million reasons not engaging in interactive lectures: games and activities are too childish for university students, I was trained in research not teaching, sacrificing important content for interaction is not worthwhile, etc. Deeply inside, however, it was the fear of losing control when conducting this type of teaching that disturbed me. I cannot accept myself losing control of the students or the class. I was afraid of not being able to deliver all of the important content in time, not knowing how to respond to some “unexpected” questions students may ask, getting no response from students when asking a question, or being dominated by a certain student group in class, etc. With reflection, I realized that all of these hypothesized situations are in fact acceptable in teaching and I don’t have to be perfect in order to become a good teacher. To conquer the fear, the first step may be to learn how to fully accept myself without any condition, i.e., I can make mistakes and this would not change the fact that I could still be a good person. This helps! When I let go of my anxiety and fear, when I be the true person who I am on the stage, I start to enjoy the interaction with my students, and I can tell from the students’ faces that they also like me in this status.

Last but not least, in preparing for my teaching on numerous issues to be discussed in this subject, I have been reminded of my responsibility as a social scientist when I have to spend time in searching for educative issues in our society and trying to analyze them from different perspectives. As a researcher, I used to focus too much on my personal interests when selecting a research topic, while take little concerns about social influence into account. Teaching the subject makes me being further aware of the implication of scientific research to the society. By performing rigorously designed studies on important social issues, and disseminating the findings, we are able to educate the public, influence policy making, and

eventually make the world a better place. The discussions with my students in class also inspired me to explore more on current issues in Hong Kong society, for example, views about morality, democracy, the general election, the Hong Kong mainland conflicts, etc. This has largely broadened my research interests and areas.

In one of the seminal books on teaching and learning written by John Biggs [30], it is said that for teachers “learning new teaching techniques is like the fish that provides a meal for today,” while “reflective practice is the net that provides the meal for the rest of one’s life” (p. 7). Similarly, Grant and Zeichner [31] argued that as a teacher “you may be able to get by, by putting little thought into your work, but if you want to strive to be the best teacher that you possibly can, there is in reality no alternative to reflective teaching” (p. 110). Reflection on teaching “Tomorrow’s Leaders” helps me to understand my students, their behaviors, needs and concerns and use this understanding to consciously guide my teaching; it also enables me to make sense of myself, what I have done in a classroom and the reasons behind, and to explore the potential impact of my action on students and myself. Moreover, if we aim to educate our students to be thoughtful about their life and eventually become an active participant with independent mind in nowadays society, the place to begin is with us and reflection plays an integral role in this process [31].

Chapter 167

REFLECTIONS ABOUT “KNOWING THYSELF”

Florence K. Y. Wu*, BA, MASGC, EdD

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hung Hom, Hong Kong, PR China

ABSTRACT

This chapter aims to provide insights gained from teaching a subject on leadership and intrapersonal development in the university setting. The teacher reflects upon how her previous working experience influenced the teaching of the subject and the development of professionalism in the university setting. It is concluded that a teacher has to first understand and know oneself and this self-awareness benefits student learning.

INTRODUCTION

“Know thyself” Socrates (469-399BCE)

This quote appears in the first lecture of “Tomorrow’s Leaders”, the subject on leadership and intrapersonal development in the Hong Kong Polytechnic University (PolyU), to share with students about the importance of self-understanding in developing one’s own potentials and aspiration in leadership. This quote also serves as a reflective remark of my teaching of the subject “Tomorrow’s Leaders” in the past two years. To “know myself” is not only to understand my role of and reflect on the teaching this Subject, but also to understand the personal growth throughout the process and accept who I really am while I am facing genuinely with my limitations and strengths in teaching this subject. Students are invited fervently to have reflections throughout the learning journey in this Subject. It is essential, too, for me as a teacher to reflect on the teaching and the personal growth in teaching the subject “Tomorrow’s Leaders”.

In responding to the drastic change of the academic structure in Hong Kong, the eight public Universities have formally transformed the structure of the undergraduate education from three years to four years starting from the academic year 2012-2013. This change urges the universities to think how to better cater the needs of the “younger” university students and thus the students would better adapt to the university environment. As such, all eight universities in Hong Kong developed new general education curriculum in each of the new four-year undergraduate curriculum. PolyU is of no exception. “Tomorrow’s Leaders” is one of the subjects in the general university requirements (the general education curriculum in PolyU) under the component “leadership and intrapersonal development”. Although there have been certain levels of leadership training in the secondary school, there is an increasing demand for the universities to nurture future leaders, especially leaders with personal qualities. What makes the subject “Tomorrow’s Leaders” unique is our belief in strengthening the “within” of the students and sharpening their awareness of their potentials and competencies to be the self-leader first and then to lead others. “Tomorrow’s Leaders” is the universal subject for all freshmen in PolyU and teachers would be meeting students from all the disciplines. This poses challenges, at the same time opening up opportunities, for the teachers to review their teaching methodologies, pedagogical arrangements and delivery of the subject and student-teacher relationships under this arrangement.

In view of professional development, teachers’ reflection on their teaching practices and experiences is crucial for the development of expertise. Coombs [1] denoted that “teachers need consciously to think about their experiences if they are to learn from them” (p. 63). Reflections help teachers to have new awareness of their teaching routines and thus to make analytical and adaptive plans to improve the teaching quality. To have a systematic yet insightful reflection, teachers could have “reflections-in-action”, “reflection-on-action” [2] and “reflection-for-action” [3]. “Reflection-in-action” refers to an individual’s ability to think about what is happening during the course of teaching. Teachers reflect upon “on the spot” situations and make immediate responses to react proactively in class. For “reflection-on-action”, it refers to the intentional revisit of the episodes or critical events happened in class for reflection. And the third type of reflection, “reflection-on-action” is the process on past actions and decisions as a means to guide future practices. In my personal experience in teaching the subject “Tomorrow’s leaders”, these three dimensions of reflection assist me in “the process of becoming” [4]—becoming more sensitive to the students’ needs; becoming more professional in delivering the subject contents; and becoming more sensible in understanding the roles of a university teacher and a researcher. This piece of reflection is not only reflecting on the teaching of a single subject, but also reflecting upon the role of a university lecturer and the meaning of quality teaching.

GETTING BEHIND THE MASK

Rogers [4] suggested in his book “On becoming a person” that there were several “steps” to let an individual understand his or her own growth pathway, which are (a) getting behind the masks; (b) openness to experience; (c) willingness to be a process; and (d) internal locus of evaluation. This piece of reflection is adopted these few steps as the framework of reflecting my own identity as a university teacher and an academia in the university setting.

Understanding the “masks”—the well-understood practices or beliefs—behind is the first step that facilitates an individual’s discovery of something more basic and something more truly in his or her life. I have been teaching in the secondary school setting in local context for ten years. This experience has equipped me with both knowledge of pedagogy and practice wisdom in educating adolescents. The experience marked an end with another start—teaching “Tomorrow’s Leaders” in the PolyU. This transition urges me to think of my role here as a teacher in the university setting. The initiation to reflect on well-established beliefs suggested by Rogers is applicable to me in such sense. As being engaged in teaching in secondary school for quite a long time, a set of educational principles, beliefs and values for adolescents has been developed in my career. On one hand, these convictions serve as the consolidation of previous teaching experience and let me have a better personal teaching efficacy [5]. On the other hand, these well-established thoughts might blind me from being aware of the growth—as I might have a thought of “have grown already”—and getting in touch of the real inner self. It is crucial for me to revisit these well-established convictions and search for their meanings on my present career.

“Florence is willing to care for each student, no one in this class feel ignored during lessons. She shared a lot of experiences that she had and help us know more about the application of the skills to the daily life.” (Student Feedback Questionnaire, APSS1L01, 2012)

“Florence is really kind and helpful, which I could feel her unconditional support towards students’ responses.” (Student Feedback Questionnaire, APSS1L01, 2012)

The interpersonal context, especially in the higher educational setting, has been often overlooked as lecturers’ expertise and “satisfied content or curriculum delivery” are determinants for effective teaching [6]. University lecturers are driving greater emphasis on the content delivery with incorporation of research findings and being less engaged in establishing relationships with students. In addition, getting too close to students and revealing self in lectures is perceived as “unprofessional” and “emotional” in university teaching [7]. However, research in recent decade finds that teachers’ self-disclosure positively affected the cognitive learning of students and there is no change in students’ perceptions of competence of teachers who frequently self-disclosed in higher educational setting [8]. Teachers’ self-disclosure is encouraged in teaching Tomorrow’s Leaders and this teaching methodology helps foster students’ capacity for self-awareness and teachers’ empathic understanding of students’ sharing. The disclosure should be an arranged one with considerations of relevancy to the subject materials, motives of sharing and teachers’ credibility. The teachers’ self-disclosure should not be a mere personal sharing of thoughts and feelings [9]. This comment from the Student Feedback Questionnaire (SFQ) recognized the help of my personal revelation of experiences on his or her daily life and my self-disclosure is shown to increase student perception of the relevancy of the subject materials.

Despite the encouraging comment of the help of self-disclosure to the students, the word “care” triggers me to go beyond the mask and reflect on my teaching style and the student-teacher relationships in the university setting. Providing caring and warm learning environment is the major task of elementary and secondary schools. The caring and warm environment provided is to cater the developmental needs, especially development of different life skills in aspects of personal, social, career aspiration and academic development of children and adolescents. A parent-like or mentor-like teacher with caring attitudes is

crucial for nurturing personal assets and strengths for children and adolescent in their primary and secondary schooling [10]. As a secondary school teacher, I was used to “taking care” the students in or outside classroom and was acting like a “parent-like” or “mentor-like” school teacher. The affective learning environment facilitates and benefits students’ growth and teachers’ professional development in nurturing youngsters in the frontline educational field [9].

However, in facing the young adults in the higher educational setting, the meaning of “care” has to be revisited. Most of the university teaching focuses on acquiring knowledge and learning theories. Teaching excellence in higher education is defined as the demonstration of lecturers’ or professors’ expertise and teaching students at an appropriate level [6, 7]. Caring about students is seldom addressed in university teaching as liberty and self-discipline is emphasized in higher educational setting. There is scant literature in exploring the issue of establishing a caring and supportive classroom or class milieu in higher education setting. Student’s comment about the care I have given in class urged me to doubt if students’ personal growth is undermined with my caring attitude and question if I am just performing as a secondary school teacher rather than a university lecturer. There was a fear of not catering the genuine needs of the students. However, students’ assurance of my care to every student, or as McCroskey and Taven [11] suggested the “perceived caring”, is seen as goodwill that opened the communication channel more widely in the classroom. Acknowledging students’ needs by providing care and the openness for communication is especially crucial in teaching “Tomorrow’s leaders”. These would provide a trustworthy and safe environment to help increase students’ motivation of sharing and reflecting upon themselves. Teachers’ care and expressiveness can contribute the teaching effectiveness by maintaining student interest [12]. And I believe that quality teaching in any of the level in the education system is not primarily an accomplishment in appropriate planning, excellent teaching technique and thoughtful pedagogical moves, but “as a lived accomplishment that is intimately linked to the way” students live their lives [13].

The reflection upon the “care” also sheds light in understanding the student-teacher relationships in university setting. Student-focused approach, for example devising teaching plan focusing on changing and developing students’ understanding; teaching at an appropriate student level; and thinking from students’ perspectives, is highly appreciated in educational setting across primary, secondary and tertiary levels [14]. The focus on students’ needs in planning the pedagogical arrangements definitely helps develop students’ conceptions and understanding of the subject matter and foster self-initiated learning [7]. Besides the pedagogical arrangements, student-focused approach to teaching also caters the developmental needs of the students, despite the level in educational system. The students enrolled in the subject “Tomorrow’s leaders” are all freshmen and “Tomorrow’s Leaders” might perhaps be the first university course they have attended in their brand new university lives. The frustrations and anxieties aroused from the adaptation to new environment might need someone to listen to. With the self-disclosing and trustworthy classroom atmosphere in the class of “Tomorrow’s leaders”, students might have shared their worries and frustrations verbally or non-verbally. There was a student sharing in the lecture “resilience” that his happiest and saddest incident is “entering the university”. I understood how this mixed feeling frustrated him and responded verbally in class of this complex feeling. At the same time I noticed some other students’ non-verbal cues, such as nodding and raising their eye brows when listening to this sharing. During the time for group sharing, I went into those groups and

listened to the students’ sharing of the issue or other related concerns. The personal authenticity in which teacher’s real human presence encouraged students to look inwardly to what their genuine needs are. Being a teacher, I have to be aware of how to understand the students’ concerns, empathize students’ views and accept them as valid views, and react to students’ communicative attempts in class accurately and quickly. The relational exchange and the understanding of their feelings connected the teacher and the student and this sense of “togetherness” nurtured a trustworthy student-teacher relationship. This might be echoing with the student’s comment of “unconditional support towards students’ responses”.

OPENNESS TO EXPERIENCE

As a teacher receiving traditional subject-based pedagogical training, my training in the educational field has limited relevance to the teaching delivery in higher educational contexts. Fortunately, some sessional and part-time university teaching has enabled me to continually improve my teaching delivery in university settings and the research conducted in my doctoral degree in relation to Positive Youth Development has enriched me with theoretical understanding of psychosocial competence in some extent. However, teaching leadership attributes with reference to the positive youth development and other related psychology theories and models [15] is still a challenge to me, especially in the time of both career and workplace transitions. Being open to the experience is another step to understand an individual’s growth and changes and challenges inspire teachers to be emerged from one’s inwardness and thus search for the best in teaching and learning [16]. Having substantial preparation both cognitively in understanding the concepts and knowledge of the subject and psychologically in facing challenge is the start. The lecture materials for “Tomorrow’s Leaders” were well-developed by the curriculum team and the lecture notes were ready-for-use for lectures. Novice teachers in higher educational settings found difficulties in planning an overall framework of a subject or a course and the unpreparedness for assuming the role of planning might bring the novice university teachers “praxis shock”—the inadequacy of executing what should be performed in the teaching environment [17]. The ready-for-use lecture materials in “Tomorrow’s Leaders” provide the lecturers a clear framework of the lecture contents and theoretical grounds of the subject, which in turns lessen our burden in planning for the whole subject and grant us capacity in refining and enriching the contents with reference of the suggested theoretical grounds and frameworks. It is gratifying to have such preparation in times of commencing the teaching career in university settings.

“Good teachers”, however, “possess the capacity for connectedness” [16]. Teachers should be able to weave the meaningful web of connections among themselves, the subject contents and their students and thus the students could learn how to weave a web of integrated knowledge and attitudes learnt in class. It is therefore essential for us to make meaning of the ready-for-use lecture materials of each lecture with reference to different constructs and link each lecture with our own understanding in relation to the theories and models presented, and the rationale of the whole subject–self-leadership. The meaning-making process of the lecture notes is not limited to revising the lecture materials to fit in our teaching styles. It is the interaction between teachers’ own frame of reference and the perception of the students’ needs resulting in the personal interpretation of the lecture materials [18]. Even if there is a

designed-rationale in the ready-for-use lecture materials, teachers could still devise a personal attempt to create new information into existing knowledge system in the meaning-making process. In addition, the sense of ownership of the lecture materials and the whole Subject assists to make the teacher a continuation of the refinement and change processes in the future, even if other extrinsic motivation is no longer present. The sense of ownership leads us to feel the urge or necessity to change, which is the motivation to improve teaching quality by consistently evaluating if we have achieved expected objectives or standards [18]. According to Pierce et al. [19], “people use ownership for the purpose of defining themselves, expressing their self-identity to others, and ensuring the continuity across time”. The well-prepared and standardized lecture materials will make less sense if there is no teacher’s identity within them. With the sense of ownership, teachers would instill their own self—my belief in promoting self-leadership; my understanding of the theories and models of leadership; my eagerness in knowing better the young adults; my passion in teaching—into the subject matter and thus to liven up the lecture materials. It is encouraging to see students understanding and echoing with my instilled “self” in the process of learning in class: “She can always make some knowledge interesting” and “The teacher’s detailed explanations for the topics with appropriate examples, as well as her enthusiasm in teaching” (Student Feedback Questionnaire, APSS1L01, 2012).

The teaching in the university setting is leaving the academic staff “isolated professionally” [17]. This isolation will often become personal isolation as well as university teaching is quite individualized that each academic staff would be responsible of his or her own courses only. The individualized nature of this teaching style prevents academic staff from sharing and examining each other’s teaching practice and reflecting upon the underlying assumptions [20]. As the lecture materials of “Tomorrow’s Leaders” are consistent throughout every class, we shared about the challenges and difficulties quite often before or after lectures. A collegial professional community in the context of teaching is gradually developed in which we can interdepend in reflecting, exploring and improving our teaching practice [21]. The sharing about the difficulties and challenges might reveal our “perceived inadequacy” in delivering the lecture materials or even if challenge our professionalism in the teaching field. However, the collaborative and supportive culture with evolutionary relationships of openness, trust and support among us grant us autonomy to define and develop our own rationale of the Subject and individualized curriculum [22]. Within the research-intensive environment in the university, exchange of research ideas or methodologies becomes the dominant trend and teaching effectiveness might not be fervently discussed, though quality teaching should have to be upheld [23]. This professional yet supportive exchange of teaching wisdom has strengthened my professional confidence in times of career change and granted the autonomy in initiating a culture of professionalism in our team.

WILLINGNESS TO BE A PROCESS

Rogers [4] stated that the individual seems to become more content to be a *process* rather than a *product*. In delivering lectures of “tomorrow’s leaders”, I am not seeing myself only as a “fixed entity” of achieving the goals and outcomes set in times of preparation. Instead, I

intend to accept a more satisfying realization of entering “the process of becoming” [4] to let myself be into the class. Besides investigating the inwardness, that is teacher’s “self” towards teaching, it is equally important to examine how the beliefs and rationale delivered to the students, that is the “process” that Rogers emphasized. In “Tomorrow’s Leaders”, students are arranged into groups in order to facilitate the interactive activities such as group discussions and role-playing. Arranging students in groups is a common pedagogical practice across different levels of education. Compared to large-class settings, the interaction among students in groups is often more cooperative and collaborative, in which to help students acquire teamwork and collaboration skills, and develop interpersonal skills [24]. Although the advantages of arranging students in groups are acknowledged, the pre-assigned random groupings have once frustrated me. Chapman and colleagues [25] suggested that students’ self-selected groups are probably better than assignment and the arrangement of the pre-assigned groups is rather teacher-focused which might contradict with my belief in student-focused teaching approach [7]. Some students might find it difficult to join in the group as they do not know each other well in times of the pre-assignment of the groups. When I let myself enter the “process”, however, I discovered that the pre-assigned random groupings have an appropriate mixture of different talents, characteristics and skills that could facilitate the students to learn from each other within the groups. As a facilitator in class, I should remind myself to maintain as space to support solitude (those who might be a bit detached from the group at the beginning) yet surrounding it with sources of other students as a community. This respectful environment would help each other remove the impediments and discernments, which in turn nourished a multi-perspective yet with respect learning environment in the “Tomorrow’s Leaders” subject.

Over-sized class in higher educational settings is one of the traditional beginning teacher horror stories. Novice teachers find their incapacity to engage students and inadequacy in managing the class in right pace and momentum [17, 23]. The conventional belief of the benefits of small class size persists in higher educational settings. Interestingly, Stes, Gijbels and Van Petegem [26] have evidence that effective teaching approaches are not related to the context itself, including the class size. I agree with Stes and his colleagues [26] that it is not the objective measures of the class size that matters but teachers’ experience or perception of the teaching and learning context that is important. Despite the large number of students in class, teachers’ cautious arrangements of both intellectual and interactive in-class activities would facilitate student learning as well. Concerning the management of the class, there is limited literature exploring the issue of classroom management in higher education setting as the setting in university goes beyond the conventional understanding of a “class”. In addition, the misbehaviors or chaos aroused in university setting are not as obvious and problematic as in primary or secondary school settings. Some university teachers found “relieved” as they have not to deal with behavioral problems and are able to connect with students more effectively [17]. There might be a mythical assumption that there should not be any classroom management in university with its liberal environment and young adults in university are free to choose the way they are. Kounin [27], however, stated that managing a class is achieving a quality lesson, despite the level of education. I believe that to manage a class is to have an appropriate pace and momentum, and smooth transition of learning activities, but not posing control on the students’ choices or learning space. What makes a class sometimes a “chaotic void” is that the teaching and learning space is without boundaries. The space should be bounded and open. Palmer [16] stated that “[i]f boundaries remind us that our journey has a

destination, openness reminds us that there are many ways to reach that end” (p. 77). A class should be with boundaries created by relevant pedagogical arrangements that keep the teacher and students focused on the subject yet students are free to speak with relevance to the topic.

INTERNAL LOCUS OF EVALUATION

Teaching effectiveness is generally defined as the “degree to which one has facilitated student achievement of educational goals” [28]. The most apparent criterion for teaching effectiveness is student learning and thus student feedback questionnaires are administered in many universities worldwide and constitute the most widely used form of teaching evaluation in higher education [29]. It serves as a means for quality management in higher education and helps students reflect upon their learning. In my previous teaching experience in secondary school, there is rare or even no such evaluation system to help teachers review their teaching performance and effectiveness. The evaluation of teaching effectiveness depends quite much on teachers’ self-reflection and relies much on teachers’ own integrity and personal and practical experience [30]. In the university setting, student feedback questionnaire is frequently used to evaluate and analyze the outcomes and impacts of these subjects on student learning and teachers’ professional development. In “Tomorrow’s Leaders”, there was a post-lecture evaluation, in both quantitative and qualitative, administered to evaluate teaching effectiveness and the achievement of learning outcomes after each lecture [31]. It was at first quite “stunning” to learn that my teaching performance would be evaluated after each lecture, though I have been quite used to review my teaching effectiveness by self-reflection when serving as a secondary school teacher. The stunning feeling was not generated because of the scores from the evaluation. It was the mirroring of self-seeing and understanding my teaching identity and teaching passion transparently—that urged me to review what benefit the student and excel my teaching most. Student feedback questionnaire, with a number of students’ genuine perception on the teaching effectiveness and teachers’ performance, did provide a platform for teachers to reflect upon their own teaching effectiveness. This might lead teachers to look to students for approval or disapproval and for standards to teach in class as well. Prosser [7], however, advised university academics “[go] beyond student evaluation of teaching and learning score to improve teaching” and Rogers [4] further posited that the locus of evaluation should lie within an individual himself or herself. “Good teaching cannot be reduced to technique; good teaching comes from the identity and integrity of the teacher” [16]. It might be more satisfying if teachers recognize the choices or decisions made for the teaching rest within him- or herself.

CONCLUDING REFLECTIONS

“...the biggest defect we human beings have is our shortsightedness. We don’t see what we could be. We should be looking at our potential, stretching ourselves into everything we can become” [32].

Being an academia in the university setting is a journey fraught with self-doubt and anxiety. My school experience, however, is invaluable in assisting in the shift to academia.

The pedagogical insights with integration of the teachers’ training and front-line experiences equipped me in facing the career change and nurtured my teaching efficacy. However, research and teaching is seen as the integral part of the academic lives and both are viewed as the functions of academia’s intellectual passion [6]. Research is stressed and publication is a must for an academia. Faced with this novice responsibility and challenge, it is easy for me to place my faith on the “known”—by focusing on my teaching. Sufficient teaching experience before joining as a role of academia would contribute to increasing professional credibility and overcoming some initial difficulties [17]. In hindsight, I am more comfortable with my teacher identity more than the researcher. Obviously, the inability of translating former expertise has led me initially suffer from “imposter syndrome”, which is referring to “individuals’ feelings of not being as capable or adequate as other perceive or evaluate them to be” [33]. This “shortsightedness”, as Morrie refers [32], might hinder my development as an academia. Nevertheless, with growing understanding of the difference of practice field and research field, and growing awareness of the genuine university setting, I saw the need to increase my research ability concurrently with learning to teach at the university. Being immersed in research while in the educational context will enable experienced school teachers to overcome major challenges faced by many novice university academics [34]. In addition, research and teaching are reciprocally inspiring each other in creating new knowledge to facilitate students’ learning in the higher educational settings [23]. Thus, it is essential for me step out my comfort zone and search for the opportunities to “stretch myself into everything I can become”.

Chapter 168

LEVELS OF REFLECTION

Hildie Leung*, PhD

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

To promote holistic development in Chinese university students in Hong Kong, a general education subject entitled “Tomorrow’s Leaders” was developed and has been fully implemented in the new four-year university curriculum since 2012. In this chapter, the Onion model is used as a framework for conducting systematic teacher reflection to enhance professional development. Challenges and issues central to the environment, behavior, competencies, beliefs, identity, and mission, as experienced and observed by a teacher of a leadership and positive youth development subject in Hong Kong are discussed. Issues include the Hong Kong education environment, the impact of reinforcement and the role of culture in teaching and learning, as well as postulations on leadership and human development. The chapter concludes with implications of the core reflection on my personal development.

INTRODUCTION

Over a century ago, Hall [1, 2] described adolescence as a developmental period of “stress and storm,” marked by mood disruptions, conflicts with parents, and risk behaviors [3]. The vicissitudes of autonomy, status, material resources, are met with increased expectations and responsibilities. The myriad of cognitive, psychological, physiological and social changes further add to result in stress experienced by these budding young adults [4]. In fact, long before Hall’s [2] delineation, Rosseau [5] had described adolescence using the metaphor of a storm:

“As the roaring of waves precedes the tempest, so the murmur of rising passions announces the tumultuous change... Keep your hand upon the helm,” he advised parents, “or all is lost.”

* Corresponding Author’s Email: hildie.leung@polyu.edu.hk.

Rousseau's forewarning should not be confined to parents, but also to researchers and educators. In light of the emergent developmental issues (e.g., mental health problems, substance abuse, and egocentric tendencies) observed in adolescents of Hong Kong [6] and attempts to "keep our hands upon the helm," a university subject entitled "Tomorrow's Leaders" (TL) at The Hong Kong Polytechnic University was developed by Shek [7]. The objective of the subject goes beyond the mere avoidance of "losing it all" or salvaging the remnants of the storm, but rather, to help these university students to weather through the turbulence by nurturing positive youth development and promoting leadership qualities in them.

Figure 1. The Onion model with the six levels of reflection [1].

The subject was piloted twice in the second term of the 2010/11 academic year, and subsequently, in the first term of 2011/12. With the inception of the new 4-Year undergraduate curriculum commencing in the 2012/13 school year, a 3-credit curriculum for TL was developed and all undergraduate Year 1 students are required to enroll in this subject. As such, my journey as a teacher (or a co-storm rider, as I perceive myself) of TL began. Evaluation studies on the subject have been conducted using different quantitative methodologies, including post-course objective outcome evaluations [8], post-lecture [9, 10] and -course subjective outcome evaluations [11], and qualitative methodologies such as reflective journals [12], and focus groups from students [13]. Findings have consistently demonstrated that the subject impacted students positively. After having taught the subject for three semesters, in the present article, I aim to share my reflection and observations from the perspective of a teacher, with the use of Korthagen and Vasolos' [1] model for systematic core reflection.

THEORETICAL MODEL FOR CORE REFLECTION

Teacher reflection is a common practice in educational settings for professional development, yet, Korthagen and Vasolos [14] warn that not all reflection can result in optimal or sustainable outcomes and professional growth, as many instances of reflection focus on identifying problems and devising solutions for specific problems in a superficial manner. Specifically, when practitioners reflect, many are prone to “focus on finding a “quick fix” - a rapid solution for a practical problem - rather than shedding light on the underlying issues determining the situation at hand.” [14]. This type of problem-based reflection seems to overlook the fact that individuals’ behaviors are guided and influenced by ones’ inherent beliefs and attitudes. Therefore, if the goal of reflective practice is to bring about prolonged professional development in a teacher, reflection must be conducted in a deeper manner to delve upon the teacher’s personal values which naturally influences (and are simultaneously influenced by) one’s interaction with students. To enable systematic core reflection, the Onion model was developed by Korthagen and Vasolos’ [1] as depicted in figure 1. The model presents different levels (i.e., content) on which reflection can center on. The underlying notion is that the inner levels of the model determine individual’s behaviors in the outer levels, and vice versa. The authors of the Onion Model warn that reflections conducted without a systematic model may remain too superficial by being narrowly confined to reflecting on behaviors, competencies, or beliefs alone. The strengths of the model lie in its abilities to help practitioners raise their self-awareness by conducting deeper core reflections at all levels, help teachers identify particularly, at which level their strengths and weaknesses are in, and highlight processes which can be deepened or broadened [1].

ENVIRONMENT

The outermost layer of the Onion model is the environment, which includes the class, the students, and the university. One of the fundamental challenges of teaching TL pertains to the nature of the subject. Higher education in Hong Kong has undergone great reform, moving from a three-year undergraduate curriculum that favors early disciplinary specialization to a four-year curriculum that aims to encourage interdisciplinary exchanges by incorporating broad-based general education components to complement discipline-specific studies; TL being one of them at The Hong Kong Polytechnic University. The implementation of effective general education, however, is challenged by the deeply-rooted traditional cultural values of utilitarianism [15]. I would like to elaborate on the above using an in-class exercise I have conducted.

In order to gain a better understanding of my students and to gauge their expectations, during the first lecture of the semester, prior to the introduction of the course content, I would distribute a small piece of paper and them to answer the following question, “What do you expect to gain after taking “Tomorrow’s Leaders”? I would then collect the sheets, which are anonymous, and share some of them with the whole class. During one semester, I received the following two responses:

“Nothing.”

“Gain credits.”

I was not surprised to receive these comments which provide support for the fact that Hong Kong is indeed a pragmatic society pre-occupied by utilitarian cultural values, which unfortunately, poses as a challenge for the general education reform. Our society emphasizes on “what works rather than philosophical debates and perspectives... Educationally, this pragmatism has also been expressed in narrow, technical specialization.” [15]. Chinese students adopt a pragmatic approach to education and expect to gain skills and social mobility through education [16]; attending university is perceived as an investment [17]. Hong Kong university students when compared with those from the Mainland were even more pragmatic and instrumental. They were preoccupied with trying to get distinctions in school, as compared with China University students who were more concerned with the quality of content included in their course materials. The authors concluded that while Hong Kong students were exam-oriented, their Chinese counterparts perceived university education as a means to equip themselves for dealing with future challenges in the changing economic environment [17]. This is also reflected through the Hong Kong education system which is highly competitive and strongly oriented toward students’ academic achievement [18]. It is not surprising that students who are brought up in such an environment would not expect to gain anything from a general education subject aimed at encouraging critical thinking, creativity, self-leadership, and reflection; these are all abstract conceptualizations to many.

While students attempt to deal with the confronted changes to the higher education system logistically, they are also trying hard to understand the educational philosophy behind the reform. To implement general education subjects effectively, I believe that as a teacher, it is pivotal to guide students to first appreciate the importance of equipping oneself with competencies beyond those taught in their own disciplines. The goal of education must move beyond the traditional training of graduates for employment confined to one’s trained discipline or Hong Kong. Instead, graduates should be trained to reach broad employment goals. This can only be achieved “by creating lifelong learners who can change careers by learning to learn... (and creating) global citizens, adults who can contribute to society and the good of the whole.” [15].

Referring back to the short exercise, I began by sharing with the class the two aforementioned comments and told them that it is understandable why some students may feel this way, and that it is alright if one is unsure of what to expect; but I go on to ask them to think about whether it is acceptable to hope to gain nothing from a subject, given how hard they have strived to enter university. I subsequently highlight the experiential and reflective nature of TL and how reflection in itself is invaluable, and whether one can gain from any experience depends on one’s willingness, openness, and motivation to immerse oneself in the experience. I then show the expectations of other students who yearn to develop themselves through TL, and reassure the class that the subject is designed to meet these expectations,

“To realize ourselves.”

“Developing skills of (being a) lifelong leader.”

“To know myself deeply.”

“Find what I want and (am) looking for, like what is meaningful to me.”

“To be brave.”

“Observation, cooperation, and communication skills.”

To conclude the activity, I shared two last responses and emphasized that TL is unique from other discipline-specific subjects in which we are not merely teaching theories and hard knowledge; but rather, we equip them with competencies that will help them find,

“The way to be ourselves. And do it well.” and
“To become an adult in the society.”

BEHAVIOR

The second layer of the Onion model is behavior, as defined by observable actions of a teacher in class (e.g., how does one deal with problems).

TL is a subject that encourages students to take initiative and responsibility in different spheres of their lives and to liberally share their ideas in class. This however, becomes a challenge due to the highly collectivistic nature of Hong Kong society [19], where students will only speak up in class when appointed by the teacher, individual initiatives are often discouraged, and students opt to conform [20]. Various reasons account for these behaviors, including the fear of losing face (*mian zi*) [21], or harsh self-evaluations subsequent to failures [18]. Recognizing positive behavior seems to be one of the solutions to overcome this challenge. According to Law and colleagues [22], providing appropriate responses of the social environment to desirable behaviors can encourage adolescents to continue to these behaviors. Positive behavior recognition strategies may involve positive reinforcement, observational learning (e.g., modeling), and unconditional positive regard. In terms of positive reinforcement, in Hong Kong it is not only parents who seldom praise or make use of positive reinforcements to motivate their children [23]; many teachers are not trained to practice these strategies either. Research has been conducted universally to identify qualities of successful teachers. Cheung and colleagues [24] interviewed outstanding teachers in Hong Kong and came up with a list of elements of personal and professional qualities that a successful teacher should have (e.g., care for students, enthusiasm, subject knowledge, classroom management, etc.). Majority of the elements from Cheung and colleagues' [24] study are in line with those proposed by Tamblyn [25] whose study was conducted in the West. However, one noticeable quality that was not mentioned by Hong Kong teachers was “the skill in the science and art of motivation through positive reinforcement.” I concur that the use of positive reinforcement is indeed a science, multitude of studies show the positive impact of reinforcement on learning, but at the same time, an art, which I am still trying to master.

Positive Reinforcements inside the Classroom

In my TL classes, I try to motivate my students using different strategies, both inside and outside of the classrooms. During lectures, every time a student shares their ideas to the class, I would verbally thank and commend them for their sharing. To model, I would also lead the class to give the student a round of applause to show their appreciation to his/her classmates' efforts and contributions to the class' discussion. In gradual time, even in the absence of my lead, students would automatically clap whenever their classmates share. This creation of a

supportive environment has resulted in significant improvements throughout the semester; students who were shy to speak up in the beginning became more willing to take initiative to share their thoughts and demonstrated higher levels of confidence while doing so. This supports “the notion of supportive learning communities (which) reflects what we have learned about the nature of individual minds operating in an enabling culture” [26]. This is in line with unconditional positive regard proposed by Rogers [27], where individuals maintain a positive attitude towards others, enabling the receiver to experience a sense of self-worth. Positive behavior recognition may be demonstrated by means of personal warmth through providing supportive verbal or nonverbal gestures [22] (e.g., thanking students for their sharing or clapping). Highly functioning communities are characterized by trust and mutual support, which is pivotal for effective pedagogy and the sustaining of productive discourse [26]. In addition, students in TL are assigned to small groups, in which they are to conduct in-class activities, discussions, and a group presentation collaboratively. This arrangement also introduces reinforcement contingencies such as, immediate consequences from peers, as well as increased interaction between students and teachers or teaching-assistants; given that our role as facilitators during these activities is to rotate to different groups to facilitate and answer questions that students may raise [28].

Positive Reinforcements outside the Classroom

Teaching TL has trained me to be more observant and sensitive to the needs of individual students. I remember there was a student in one of my classes; he was never very enthusiastic about participating in any group activities, and was sometimes late for class. I had tried different motivation strategies during class, but somehow it never really succeeded. Until suddenly one week, I observed that he had made the slightest improvement in one of the activities that day. I recall that the activity required students to exercise their creativity and aesthetic skills to express qualities of a successful leader. So after class, I emailed him to acknowledge his efforts in taking responsibility for his learning, and complimented him for his creative input in that activity. To my surprise, he began to be more participative in our in-class activities and showed increasing interest and enthusiasm in subsequent lectures throughout the semester. In TL, we always encourage students to reflect and identify their own potentials, but as a teacher of TL, it is of equal importance to be sensitive to each student’s unique interests and potentials. It is often in these eureka moments that we are able to provide the positive recognition needed for their healthy development. In addition to sending individual emails to certain students, after each lecture, I also post weekly announcements on Blackboard to thank the class for their active participation, and highlight one or two episodes from that particular lecture to compliment them on. I find that students appreciate this form of encouragement, as evidenced by qualitative comments from student feedback questionnaires and reflections on the subject,

“I appreciate the lecturer’s attitude very much. She sent us emails after the lectures and motivated us to participate in the lectures, which encourages students to respect the class much more.”

“I would like to thank the teacher for her passion in teaching and encouragement; emailing us after each lecture and uploading photos from class. The feeling is that of a teacher and friend. Thank you for their dedication.” (Comment translated from Chinese)

Echoing the idea of motivation through positive reinforcement being an art, Picasso once said, “Some painters transform the sun into a yellow spot, others transform the yellow spot into the sun.” I vie to be the latter by motivating and reassuring my students that they all have the potential to shed light and be radiant.

Positive Self-Reinforcement

Self-reinforcement refers to the administration of rewards to oneself in the absence of external control. Self-reinforcement plays an important role in positive development, as it acts as a link between one’s self-concept and overt behaviors. For instance, positive self-evaluation statements function as positive reinforcements for future behaviors [29]. In fact, recognition of one’s positive behaviors and strengths can facilitate adolescents’ development of a positive and healthy identity and also serves as a protective factor [22]. In the lecture of positive and healthy identity, students are invited early in the lecture to make reflections on their real and ideal selves. An initial observation is that they are quick to write negative descriptions about their real selves (e.g., lazy, pessimistic, and even, ugly); as aforementioned, this may be influenced by their upbringing where Chinese parents seldom praise them for their achievements. However, as the lecture progresses, students are then guided to reflect particularly, on their strengths in different domains of their lives (e.g., at school, home, in sports teams, among their peers, etc.), and to write down practical behaviors/achievable goals they can reach in order to realize their ideal selves. At the end of the lecture, students are asked to stand up and verbally reaffirm themselves of their strengths and abilities to reach their set goals. The self-reinforcement strategies applied in this lecture, and similarly throughout the semester, have helped students develop a more positive identity, as shown by their comments:

“Sometimes we do not like ourselves, but this lecture reminds me that actually I am beautiful just the way I am and I should love myself more.”

“It is difficult to be an ideal self. But I will try my best from now on.”

Modeling

Modeling is demonstrated in numerous educational settings; it refers to teachers’ demonstrations of concepts to students. Research has shown that individuals learn naturally by observing others, and thus effective modeling for student imitation is a useful tool in classrooms [30]. For instance, this subject requires students to engage in self-reflection and to share their experiences with their classmates. However, students are often shy and reluctant to do so. One of the most effective ways to encourage student sharing is for teachers to model the act of sharing through self-disclosure (i.e., the revelation of past experiences, stories, genuine feelings and thoughts with students). Appropriate use of self-disclosure has been shown to be effective for student learning and strengthening of teacher-student relationships [31]. Indeed, students in TL are more comfortable to talk about their experiences and feelings subsequent to listening to my sharing as a teacher. While mathematics lecturers may demonstrate how to do calculations to arithmetic problems, or teachers in nursing may show

students how to draw blood from a patient; what a teacher in TL “models” is not confined to discipline-specific task competencies, but also one’s attitude as a leader. Within a classroom setting, the teacher is the leader that students will first look up to in attempts to identify leadership qualities to imitate; as such, leadership behaviors/attributes exhibited by a teacher in class becomes critical. This will be further elaborated in the following level of reflection.

COMPETENCIES

The third layer of the Onion model is competencies, which refers to teacher’s integrated knowledge, skills, and attitudes [32]. Lowman [33] observed that “college classrooms are dramatic arenas first and intellectual arenas second.” He does not imply that teachers should put up a facade, but rather, to make use of the classroom environment as a stage to create an emotional effect on students. Many of the topics in TL, such as resilience, morality and integrity, positive identity, and spirituality require teachers to set an emotional tone to facilitate deep reflections prior to changes. Any of us who have watched a moving performance would agree on its lasting impact. Similarly, Lowman further asserts that “Good lectures are difficult to ignore.” A competent teacher is someone who is able to put on a stimulating performance students will not forget. Such performance is one where play becomes so real that its distinction from reality is difficult. In order to achieve this, actors have to be “in character.” This is similar to the notion of presence in teachers; the idea of “being-while-teaching.” Teaching presence means that teachers are “wide awake to one’s self, to one’s students and to their learning in such a way that that learning is served through skillful and compassionate analysis and access to both subject matter knowledge and pedagogical strategies” [34]. In order to achieve this, there must be a harmonious connection between one’s professional knowledge and beliefs with one’s behaviors. It is to teach with integrity; - to “walk the walk.”

As a teacher of TL, one discusses many topics such as emotional competence, resilience, morality, sense of responsibility, and effective leadership, which are all competencies and values reflected in every word we say, or action we make in class. During my first semester of teaching TL, I remember being very disappointed after my lecture on Spirituality. The content of this lecture, particularly, spoke to me in great depths, as it gave me a chance to reflect on my meaning in life and role as a teacher. I held high expectations that the lecture would impact on my students the way it had on me. Unfortunately, many students found the concept to be abstract and difficult to relate to. I was upset and for the first time in my teaching career, I cried in front of my class as I shared how I felt. Of course, it did not occur to me at that moment that any student would take this incident to heart. This was until after the semester had ended, when I received an email from a student;

“Thank you for this semester’s Tomorrow’s Leaders! To make a long story short, I love the feeling of struggling, and to find this feeling on you as well. We all know there are quantities of difficulties during the process of this course, while you still stick to teaching us seeking for the best effects.

I still remember the time that you teared, because I am always moved by myself to cry as well, and others can be surprised by us...”

In TL, we teach students the importance of being resilient even in face of obstacles and difficulties. I feel it is important as a teacher to demonstrate this kind of courage and persistence. As alike with other constructs we teach, it is crucial that we act as role models, to be present and practice what we preach at all times.

BELIEFS

The fourth layer of the Onion model is beliefs. Before teaching TL, one of the subjects I have been teaching is industrial and organizational behavior, which of course, is a subject that includes a wide range of leadership theories and models. Therefore, I would say that the greatest “belief assimilation” I have had to undergo is that related to notions of leadership. First, most traditional leadership theories and models focus on investigating situational and task competencies of leaders, i.e., “hard” skills that are likely to result in positive organizational outcomes. Few theories are concerned with the “soft,” intrapersonal and intrapersonal competencies of effective leaders, of which we now know, are equally important for positive outcomes of leadership [35]. Second, trait theorists argue that certain individual traits differentiate leaders from non-leaders and assume that leaders are “born” [36]. Over the summer, some of my students attended an exchange program in China, where they had the opportunity to visit large multinational corporations and to engage in dialogues with “leaders” of these corporations. A (rather confused) student returned and shared that one of the leaders boldly claimed that “Leaders are born! Some people are born to be leaders, while others are not.” Some firm believers of trait theories are unable to appreciate the situational influences on leadership and the malleable nature of personality. But as a teacher of TL, this fixation becomes detrimental. It is important for a teacher to challenge the underlying assumption proposed by trait theorists and more importantly to clearly convey to students, the belief that “Everyone can be a leader.” If not, all else will be in vain. The second belief about leadership which lays foundation for the subject’s endeavors is the concept of self-leadership. Most existing leadership theories are about leading others, but in fact, before one can lead others, one must first be able to lead one self. As a teacher of TL, it is crucial to highlight the fact that as individuals, we have the free-will to make decisions and our behaviors are determined by the choices we make. As such, the subject aims to nurture students who are able to effectively lead themselves to make wise and moral decisions in life.

IDENTITY

The fifth layer of the Onion model is identity, which refers to how one defines oneself, specifically, how a teacher sees his or her professional identity. Reflection at this level pertain to questions such as “Who am I?” or “What kind of teacher do I want to be?.” It is agreed among scholars that teacher identity is dynamic [37], and can be impacted by factors such as one’s emotions, life experiences, and teaching contexts [38, 39]. The process of self-evaluation enables one’s identity to be “continually informed, formed, and reformed” [40]. On reflection, teaching TL has not only resulted in a reformation of my professional identity

as a teacher, but also reinforced my self-identity as a Chinese. I would use Yin and Yang to describe my experience in TL on this level of reflection.

The Yin: “Who Am I?”

Having been educated abroad and teaching and researching on psychology and leadership theories and models developed predominantly in the West, it has seldom occurred to me the strong relation between my heritage and what I teach. As I teach the subject, I learned to appreciate the traditional Confucian teachings and came to the realization that in fact, many of the theories that I have been teaching and researching on for years have been notions and ideologies that have long existed in traditional Chinese culture. The TL curriculum has been carefully designed to maintain elements that have been shown to be effective in the development of positive youth development programs, such as the importance of incorporating relevant theoretical models and research findings from both the Western and Chinese context, the inclusion of cultural elements, and considerations of cross cultural differences in the program [41]. TL is a subject that requires and facilitates students to exercise and nurture the habit of self-reflection, to gain a higher level of self-awareness and to identify one’s potentials and weaknesses. Introspection was advocated by Confucius as found in his teachings in “The Analects” [42], “Every day, I look inside my own soul to find if I have done anything that betrays myself.” It is thought that through introspection, one is able to continuously improve oneself in order to reach higher standards of achievement [43]. In addition, many of the constructs that are covered across the weeks in the curriculum share core Confucian ideologies. For instance, a lecture on self-leadership discusses how individuals manage, influence, and lead oneself to establish self-direction and motivation to attain goals [44]. This resonates Confucian culture’s emphasis on self-cultivation, where one’s continuous effort to build one’s character is perceived as a moral value itself [42]. The importance of developing a sense of responsibility to one’s self, family, and the community is also highlighted in TL, which are tantamount to the fulfillment of obligations as advocated by traditional Chinese doctrines.

The Yang: “What Kind of Teacher Do I Want to Be?”

In TL, students are encouraged to be creative and to freely share their thoughts and ideas with other classmates. Teacher-student dialogues and self-disclosure of teachers are highly valued. These individualistic behaviors seem to contrast with the collectivistic society of Hong Kong. I find Hofstede’s [45] cultural dimension of power-distance to be particularly relevant to my teaching of TL. Power distance refers to the extent which authorities (i.e., more powerful members) of an organization should have control over their subordinates (i.e., less powerful members). Hong Kong is a society relatively high in power-distance [19]. Students in these cultures are dependent on teachers for their learning, communication in class is one-sided and initiated by the teacher, and teachers are perceived as “gurus” who transmit knowledge and personal wisdom and truths to students [46]. Having been accustomed to traditional forms of “one-way” lecturing, I find that one of the challenges I had

was to lower my position as the teacher or authority figure who “knows it all,” to more of a facilitator to observe and stimulate students’ learning. This shift from a teacher-centered approach to a student-centered classroom encourages students to take responsibility of their learning and to perceive me as more of an equal to them. A psychological hurdle that I encountered was that I had to first accept the fact that I really did not always have the “right” answers to every question. When conducting lectures in the past, I was confident that I was familiar with the theories being taught and was able to cite studies and figures that supported what I was teaching; to a great extent, I was convinced that I had the “right” answers to many questions raised in class. Teaching TL is a different story; the subject is not about transferring truths to students, many of the discussions, for instance, on morality and integrity, and spirituality, do not require an absolute answer. I would share my views or what I would do under different circumstances with my students, but by no means were they considered as truths. My role instead, is to act as a facilitator to help students find their own stance on these issues. Without undertaking the role of the “guru,” the power-distance between my students and I were greatly reduced, we were no longer unequals, but equals with shared leadership [47] roles of both teaching and learning. This notion of shared leadership, in fact, is not so much in contradiction to traditional Taoist’s teachings of selflessness and Confucian’s notion of providing service or even sacrificing the “little me” (*xiao wo*) (i.e., one self) for the benefits of the “big me” (*da wo*) (i.e., the community in which one is embedded in).

In TL, we hope that students are able to develop healthy selves, but more importantly, to help them find their contributive roles in the bigger Self. I quote John Maxwell in my lecture; “Leaders must be close enough to relate to others, but far enough ahead to motivate them.” which I feel coincides with how I see my leadership role in TL. In terms of my professional identity as a teacher, I believe that it is about striking a balance between the dualities of Chinese and Western teachings and orientations, on both a theoretical and pedagogical level.

MISSION

The inner most layer of the Onion model is mission, concerned with “highly personal questions as to what end the teacher wants to do his or her work, or even what he or she sees as his or her personal calling in the world” [48]. The analogy of the teacher being a planter of seeds is familiar to many. As educators, we aim to plant seeds of knowledge in our students, and hope that they will flourish in time as they develop. I believe that my role as a teacher is to provide students with a supportive environment that encourages self-reflection and discoveries of personal strengths. Especially given the fact that many of these students grow up in a culture where upward comparison is common and positive reinforcement is rare. It is only with self-confidence and awareness of one’s potentials can one truly thrive and excel. More so than that, adolescents nowadays are confronted with aversive temptations which can easily lead them astray. Shek and colleagues [49] reported observations of increasing instances of problem behaviors in Hong Kong adolescents, including substance abuse, internet addiction, premarital sex, and overemphasis on money and material possessions. In this harsh climate, it is not any type of seeds that teachers plant, but rather, seeds that will be able to survive in all kinds of “dirt” and to transcend hardships to blossom in the toughest weathers. Shek [50] shared that the Chinese term for leaders (*ling xiu*) comprises of two

characters, meaning; collar and sleeves, which can easily get filthy when one finds him/herself in hard work. Inevitably, our leaders of tomorrow will face moral dilemmas, and as a teacher of TL, I believe that my role is to accentuate the importance of self-cultivation in the upholding of moral beliefs as a life-long pursuit.

PERSONAL DEVELOPMENT

TL has helped me develop professionally in that it has changed my perception of what a teacher should aim to achieve. Teachers easily fall into the trap of being overly outcome-oriented; after all, teaching effectiveness have traditionally been measured by the achievement of learning outcomes mainly reflected by students' scores in examinations. Admittedly, before I actually started teaching TL, I was primarily concerned with observing whether my students would be able to demonstrate the attributes I was about to teach in class each week. Yet paradoxically, I was not sure as to how much to expect regarding the impact of a general education subject on students. This was probably due to the fact that I have never taught, nor taken any subjects alike during my undergraduate or postgraduate training. So frankly, I came into teaching TL with a high degree of openness accompanied with a sense of curiosity as to the extent that TL would impact on my students. I started teaching TL with the feeling that it is like driving on a highway with no streetlights at night; you can only see what is in front of you and know that you are getting closer and closer to where you want to be, but exactly how far you are away from your destination is not always clear. In reality, the impact of the subject soon became apparent. With only a few weeks into the semester, students had already demonstrated significant changes in their behaviors. Improvements in learning attitude (e.g. punctuality, attentiveness, and openness) were clearly evident, and by the end of the semester, majority of students had demonstrated development and showed maturity in many aspects. However, I gradually came to another realization that in fact, I must not try to reach a destination; there is no such thing as an ultimate destination, since all students internalize, learn and develop at their own pace, and each student has their own destination. My belief now is that the value of TL (or teaching TL) is more of a means to an end rather than an end itself. Leadership is a lifelong journey and not a destination in my students that I should "drive" towards, but more important is the ride itself.

Making the ride worthwhile has two meanings for me; professionally, it is about fine-tuning my teaching skills through evaluations, self-reflection, training and practice. Personally, it is on finding inspiration and joy in teaching and in life. Each semester, I show a video of the commencement speech that Steve Jobs gave at the Stanford University [51], although I have watched it for several times, every time I am inspired differently. Jobs said,

"Your work is going to fill a large part of your life, and the only way to be truly satisfied is to do what you believe is great work. And the only way to do great work is to love what you do. If you haven't found it yet, keep looking. Don't settle."

In my students, I see inquisitiveness, wonder, openness and critical minds. I remind myself that I ought to be like them, I must find something to learn, to love, and be inspired about in every lecture I teach or everything I do, no matter how many times it has been done before.

It is easy to succumb to mundane in life; it is the safe thing to do. Some university lecturers are critiqued for repeating the same PowerPoint slides (and even jokes!) year after year, it is indeed tempting to do so. I believe that as a teacher who will teach this subject repeatedly, it is important to be sensitive to the needs of different student populations across semesters. Students in different disciplines may need more specific examples to illustrate certain theories or concepts which may be foreign to the training they are used to. For instance, if I were to teach engineering students again, I may allocate more time on demonstrating empathy and interpersonal skills to this group of students. When I teach design or nursing students, I may provide more opportunities for them to exercise their cognitive skills in systematic problem-solving. Effective teachers are like parents who must be sensitive and responsive to the needs of their child. Thus, I would like to conclude my reflection with excerpts from the poem “On children” by Khalil Gibran [52] which happens to be how I perceive myself as a teacher of TL,

“... You may give them your love but not your thoughts.
For they have their own thoughts.
You may house their bodies but not their souls,
For their souls dwell in the house of tomorrow,
which you cannot visit, not even in your dreams...”

You are the bows from which your children as living arrows are sent forth.
The archer sees the mark upon the path of the infinite,
and He bends you with His might that His arrows may go swift and far.
Let your bending in the archer's hand be for gladness;
For even as He loves the arrow that flies,
so He loves also the bow that is stable.”

Chapter 169

RIDING ON A ROLLER COASTER

***Janet T. Y. Leung**, PhD, RSW**

Department of Applied Social Sciences, The Hong Kong Polytechnic University,
Hong Kong, PR China

ABSTRACT

A university subject on leadership and intrapersonal development was delivered during the academic year of 2012-2013 to the first-year university students. The teacher taught four classes of totally 268 undergraduate students coming from four different disciplines. The teacher shared her experience in teaching the subject with reference to the stages of forming, storming, norming and performing that the students had gone through. Personal reflections on teaching the subject as well as perceived benefits to the students were also highlighted. The teacher deeply reflected the essence of university education in the cultivation of the leadership and intrapersonal attributes of the students. In facing the growing trend of “McDonaldization” and commercialization of university education, a general education subject that emphasizes the intrapersonal and interpersonal qualities of the students, and fosters the holistic development of the students is essential in university education.

INTRODUCTION

During the academic year of 2012-2013, I taught a university subject on leadership and intrapersonal development named “Tomorrow’s leaders” for the first-year students in The Hong Kong Polytechnic University. I taught four classes of students coming from four different disciplines, including applied science, humanities, building and construction, and nursing. The class sizes were 56, 43, 86, and 83 respectively.

During the last lesson of “Tomorrow’s leaders,” each student was invited to share a metaphor that could best describe the subject. They then discussed in their groups and selected the most representative metaphor that would be shared in front of whole class. One

* Corresponding Author’s Email: janet.leung@polyu.edu.hk.

group from the nursing discipline drew a shoe-shaped roller coaster to represent the subject (see appendix 1). The students explained their journey of “Tomorrow’s leaders” as a roller coaster ride that had involved four stages: (i) Initial stage: this stage was filled with “uncertainties.” They were wondering about the nature and the content of the subject, reasons for studying leadership and intrapersonal qualities in the university, and the assessment of the subject (students were keen to respond to assessment as they had gone through various examinations before entering university). (ii) Enjoyable stage: students were getting familiar with the “task” and “people” of the subject. They were acquainted to the format of “teaching,” which included experiential games, reflective exercises, sharing etc., and became more interactive with their classmates (they were first-year students who were not familiar with each other before) and lecturers. There were funs and thrills when riding over the peaks, but there were boring moments when waiting for the next peak. (iii) Advancing stage: this was the stage that the students needed to do their group presentation. They became more active in the participation. This was the real stage to examine their different competencies and courage, and they experienced more group cohesion and conflicts. (iv) Ending stage: The various moments of the journey brought an unforgettable memory in their university life, and finally, they were unwilling to leave the roller coaster! The shoe-shaped roller coaster represented that they have to learn how to “walk” in their own lives. I was thrilled by their thoughtful idea and earnest sharing. Their learning experiences inspired me to think over my teaching experience of the subject. And I echoed with them. I also have had a memorable journey on a roller coaster ride.

In the lecture of team building, the stages of team development suggested by Tuckman [1] were introduced. There are four stages of team building: forming, storming, norming and performing [1]. Echoing with the stages, Whittaker [2] also identified five stages of group development which was widely used in social group work: pre-affiliation, power and control, intimacy, differentiation and termination. Though a class of over 50 students would never be equivalent to a group, the stage development models give us a useful skeleton to understand the learning progress of students, the interactions between teachers and students, as well as the reflections on teaching the subject. Hence, in this paper, I would share my teaching experience of the subject of Tomorrow’s Leaders in three aspects: the different stages of the subject implementation, personal reflections, and perceived benefits to the students.

AN ADVENTURE, A CHALLENGE, AND A MOVE

Adolescents nowadays are growing up from a rather prosperous and protective environment. On one hand they receive better care and nurture from their families and schools, which may facilitate them to become special, confident and achieving individuals [3]. But on the other hand they are sheltered and protected, which may foster the egocentric, narcissistic and cynical characters [4].

Growing up from a “4-2-1 indulgence” culture (i.e., four grandparents and two parents spoiling one child) [5], as well as the popularity of having the maids to do housework, Hong Kong adolescents have become the “little emperors” in their families. The adolescents today are labeled as the “spoilt generation” who show signs of narcissist traits [6], and as “Hong

Kong Kid” who are “unable to look after themselves, have low emotional quotients and even lower adversity quotients.” [7].

The university students belong to this generation. There was evidence showing that university students were vulnerable to narcissism [8]. Against this background, a three-credit-bearing subject entitled “tomorrow’s leaders” that focused on leadership and holistic development was developed and implemented in the Hong Kong Polytechnic University. The subject lasted for 14 weeks and covered different topics, including personality, cognitive competence, resilience, emotional competence, moral competence, spirituality, positive and healthy identity, social competence, interpersonal communication, team building and self-development.

Before teaching in the university, I had been a social worker for 20 years, mainly responsible for youth, family and community services. When I was a frontline social worker, I used to help the adolescents understand and develop themselves through guidance work and socialization programs. The experiences were rewarding when the adolescents shared their joys and sorrows, recognized their potentials and searched for their purposes of life. They were empowered. Gratefully, I witnessed the positive changes and development of the adolescents in their walks of life, and these have been some of the sweetest memories in my professional life. As adolescence is a critical stage for the adolescents to search for roles and identity [9, 10], a good adjustment during this stage would help adolescents to smoothly transit between the stages of childhood and adulthood, and build up their role commitment to themselves, their families and the society they belong. As suggested by Astin and Sax [11], the “affective outcomes such as self-understanding, tolerance, honesty, citizenship, and social responsibility” (p. 587) are important elements for university students. “Tomorrow’s leaders,” a general university education that focuses on leadership and intrapersonal qualities, may provide university students with insights on their intra-personal and interpersonal development. The subject was attractive to me – a chance to accompany with students in their journeys of self-understanding and holistic development. Under these considerations, I decided to make a move to teach this subject.

EXPERIENCES OF THE RIDE: TEACHING THE SUBJECT OF “TOMORROW’S LEADERS”

There were mixed feelings before teaching “Tomorrow’s leaders,” which was similar to the moment waiting for a roller coaster ride. On one hand, it was exciting, thrilling, and aspiring, as this was a refreshing experience to teach leadership and intrapersonal qualities in the university, and accompany with the students in joys, sorrows, struggles, insights, challenges and breakthroughs. But on the other hand, I was anxious and worried. The subject went beyond knowledge transfer. It touched upon the personal development of the students. Thus, it was more demanding for the teacher, and the steps were not easy. In order to have a better psychological preparation for the teaching, there are some tips:

- Be familiar with the concepts of the positive youth development attributes and the teaching materials;

- Collect some daily-life materials related to the positive youth development attributes, such as video clippings of resilient stories; newspaper clippings about integrity concern etc.;
- Cognitive and real rehearsal of lecturing.

The Forming Stage

“Unfamiliarity” is the word used to describe the psychological state of the students. Being the freshmen of the university, students were unfamiliar with the new subject, the learning patterns, the lecture hall, their classmates, and the teacher. Besides, leadership and intrapersonal qualities as a teaching subject was uncommon among the students’ learning experiences in their secondary school lives. Furthermore, with the rise of specialization and professionalism in the competitive world, the outcomes in tertiary education focused much on the technical and occupational domains, with holistic development of young people being ignored [12]. University students became more instrumental and functional in perceiving their needs and the purpose of education. Thus, the students showed approach-avoidance behaviors in the first few sessions. While majority of the students tried to comply with the rules and regulations and tuned into the learning environment, there were always some students who were uninvolved and non-attentive. Some students had biases and preoccupations that the subject was unpractical for their professional qualifications, and some had never thought to become leaders. Besides, as the students were unfamiliar with their group-mates, they were hesitant to disclose themselves in the sharing. More warm-ups and encouragements were needed in the group sharing. Another observation was that the students were not getting used to self-reflections, as this approach was not a common way of learning in their primary and secondary school lives. Acknowledgement of the subject’s objectives as well as familiarity with the environment was the primary emphasis in this stage. Three key attitudes and actions are crucial: openness, respect and encouragement. Openness is the key to access of knowledge, respect is the bridge between the teacher and the students, and encouragement is the direct engagement of the students. With respect to teaching, there are some suggestions that may help to build up familiarity of the students with the subject and the learning environment:

- Engage the students and build up rapport with them;
- Clarify any uncertainties, preoccupations, biases and queries;
- Establish the class norms;
- Allow students to foresee what would happen in the lectures;
- Build up patterns of collaborative learning and mutual sharing;
- Emphasize the importance of both conceptual and experiential learning;
- Build up a supportive learning environment such as introducing the useful resources to the students.

The Interplay of Storming and Norming Stages

At this stage, the students were getting familiar with the learning patterns of the subject, the classmates and the teachers. They participated more openly and naturally in class. The teaching content of intrapersonal qualities of resilience, moral competence, spirituality, healthy and positive identity, as well as interpersonal qualities of social competence and interpersonal communication required them to have active sharing and genuine reflections. Some topics were seldom touched upon by the students (such as spirituality), some were relatively personal (such as healthy and positive identity), and some were very interactive (such as social competence). Nevertheless, they were fundamental attributes for the students to understand themselves, to interact with others, and to stand firm and honest in the society.

When students got familiar with the learning environment, more commonness as well as diversity was experienced in the class. Unlike group development that has clearer stages of development, the class of “Tomorrow’s leaders” undertook the interplay between “storming” and “norming” stages. While students established group norms and interactional patterns within their groups and the class as a whole (norming), there were conflicts and diversities in their interactions that might affect their relationships (storming). Informal group leaders were identified, but at the same time subgroups were formed. On a roller coaster ride, this is the stage with ups and downs. Sometimes, the teacher was thrilled by the students’ active participation. The insightful ideas, personal reflections, genuine sharing, creativity of students were positive triggers. But sometimes, the teacher was frustrated with the apathy of the students.

Another critical process during this stage was the preparation of the students’ group presentations. As freshmen who might not have prior experience of conducting academic presentation, this task drew the students together to work for a common goal, but at the same time brought them to resolve conflicts, polarities and animosities that might arise. It was found that positive leadership was critical at this stage to build up group cohesion, boost the group-mates to participate, coordinate the preparatory task, and set up the standard of their performance. This would enhance the “norming” of the group and facilitate the transformation to the “performing” stage [1]. On the contrary, if positive leadership among the group was absent, the group was disorganized and the group members were disengaged. They might experience a loss of direction and cohesion, and the students easily got frustrated with the presentation task. As a result, the “storming” stage was prolonged. Hence, we did not only “teach” leadership in “Tomorrow’s leaders,” we encouraged the students to practice leadership in reality. I have heard a comment from a student:

“We used to do presentation in every subject. In other subjects, we simply divided the task into several pieces and each prepared his/her own part. But in this subject, we gathered together several times, brainstormed the presentation content and activity. And we shared the materials together, including the books, articles and video clips from the Web. We boost one another up at late night. We worked as a group!” (A student from the Faculty of Building and Construction)

Frankly speaking, not all the groups experienced this positive group process. Some were very instrumental and just wanted to get the task done, some had conflictual views and later burst into hot arguments, and some had free-riders and those who were hard-working had to share others’ burdens. To facilitate the positive learning experience of the students, there are some tips that are worth-noting:

- Illustrate the concepts with daily life examples so that the students could grasp the concepts easily;
- Have clear expectations and guidelines on students' presentation, and share with the students during the lectures;
- Conduct preparatory discussion with the groups and support them to make academic presentations;
- Identify the group leaders, be sensitive to the group dynamics and respond appropriately to their needs;
- Encourage the students to search for their unique features in their presentations, such as narrowing down their presentation topics, relating the topic with their major program, making self-reflections etc.

The Performing Stage

I always refer group presentation as the time of the harvest – Students consolidate and crystalize what they have learned and perform a group presentation in front of the whole class. The presentations reflect the students' understanding of the concepts, their creativity and motivation to excel, and their group's effort and cohesion. Students turn from a relatively passive role to an active role during the presentation. This is always a rewarding experience for a teacher, when we witness the students to acquire, digest, apply and reflect on what they had learned. I still remembered clearly how a group of students majoring in Building and Construction produced their own video to illustrate the concepts of social competence, and a group of Applied Science students made a splendid presentation on the sophisticated theories of utilitarianism and libertarianism in relations to morality. There was a group of students in Humanities who led an impressive reflection on how materialism eroded one's spirituality, and a group from School of Nursing shared an inspiring video emphasizing the importance of empathy to patients. The students always surprised me on their creativity and originality in their presentation, and kept reminding me that they did have views and opinions on the topics they presented – they are the masters of their own lives.

On a roller coaster ride, this is the stage when you appreciate the beautiful scenery at the top of the peak, and share the exciting moments with the participants on the ride. You are amazed with what you have seen, and enjoy the moments of what you have experienced.

To make the ride a facilitating learning experience, a constructive feedback on the students' presentation is essential. The learning experience can go beyond the positive youth attributes that the groups has presented, and let the students reflect and cherish the learning process that they have gone through. Appendix 2 is an example of my feedback on a group presentation.

The Termination Stage

Mixed feelings were experienced in this stage, just as when you get off from the roller coaster ride. A sense of achievement and excitement filled with unforgettable memories was experienced, accompanied with a sense of weariness after the fourteen weeks of intense

involvement. During the last lecture, we shared the process with the students, and evaluated the perceived effectiveness of the subject. Many students expressed that they treasured the experience and enjoyed the “ride,” but still there were some who did not appreciate the journey. I have learned to accept the fact, we cannot force every student to love to reflect and make changes, but we do have a simple belief that once the seed is sown, life starts. When the harvest would be is just a matter of time.

Perhaps we may find some answers from their term papers. Students were requested to write a paper covering two parts: critically discuss the concept of a positive youth development attribute and make self-reflections on the possession of the attribute. From their papers, we could share the students’ stories and struggles in facing their own weaknesses. At the same time, we could hear their triumphs when they discovered their strengths. There were many touching self-reflections showing the students’ passion towards their lives. For instance, a student shared her experiences of loss of direction in her secondary school life, and finally discovered her future goals that she decided to commit. Another student shared her resilient story when her father passed away, and how she recovered from the loss.... Simultaneously, we realized that the seeds that we had sown would germinate and grow.

As a subject on holistic development, we expect that the students could keep on searching their life goals and reflect on their life experiences. The roller coaster ride has a terminus, but life is a continuous track filled with experiences. Attitude is latitude! It is important to help the students consolidate the experience and transform them into motives. There are some tips that may be useful:

- Recall the memories of the lectures, group sharing, preparation and performance of group presentations, and appreciate the effort that they have made in their learning process;
- Guide the students to pick up the changes that they have gone through, and celebrate for the positive changes;
- Have clear expectations and guidelines on writing the term papers, and share with the students during the lectures;
- Invite the students to integrate the theories into life practice; and do personal reflections in the term papers;
- Give constructive feedback on their term papers, and give encouragement to them in their reflections.

REFLECTIONS ON TEACHING “TOMORROW’S LEADERS”

Being an experienced social worker but a green teacher in the university, teaching “Tomorrow’s leaders” brought many reflections to me. We are born in a “fast-food” culture, and the emerging “fast-food” attitude has penetrated in every part of our lives. We ask for immediate returns, and perform the cost-benefit analysis to calculate the worth of an action. Ritzer [13] used the term “McDonaldization” to characterize the overwhelming emphases of “efficiency,” “calculability,” “predictability” and “control” in different spheres of life. McDonaldization of the university (or McUniversity) has become the growing trend in higher education, where university serves as a means of consumption for the students to “consume”

knowledge [14]. Knowledge has been reduced to a “commodity.” Another challenge that we have to face is that university has been regarded as a factory production line to “manufacture” the technocrats and professionals that fit the labor market demand [13], and as a “tertiary-level industry” to build up national and international standing so to attract international students [15, 16]. The “commercialization” and “industrialization” of the academy seems inevitable in the changing world where specialization, professionalism and competitiveness are stressed. University has become a vehicle to serve the market, instead of being a platform to nurture the holistic development of the students, and cultivate their civic responsibility to contribute to the society. Chickering [17] strongly commented that universities “have generally ignored outcomes related to moral and ethical development as well as other dimensions of personal development” (p. 1) and “have failed to graduate citizens who can function at the level of cognitive and moral, intellectual, and ethical development that our complex national and global problems require” (p. 3).

The impacts of McUniversity were penetrative, when the students queried about the need to study leadership and intrapersonal development in the university, or when they asked the relevance of leadership attributes to their professional qualifications. Students become more instrumental in selecting the subjects, and their perceptions on “usefulness” of the subjects are often constrained to the grades, qualifications and ease of employment that the subjects would bring to them. However, Jasper [18] reminded us that the principle of the university is to “furnish all the tools and offer all possibilities in the province of the *intellect*, to direct the individual to the *frontiers*, to refer the learner *back to himself* for all his decisions, to his own *sense of responsibility*” (p. 66). There were two twin visions that a university should possess: knowledge of self and knowledge of the boundaries of life outside self [19]. “Tomorrow’s Leaders,” for me, is a restatement of the importance of holistic development in the tertiary education, though it is becoming more challenging to be fulfilled in this era. In responding to the queries of the students on “why” they have to study leadership and intrapersonal development, or when facing the apathy of some students in their reflections and participation, frustrations and despair might arise. The roller coaster journey may not always be a pleasant experience – we may have a dizzy moment. There are three tablets there are very useful: (i) Emotional competence – this is the moment of self-awareness, self-management, self-motivation, relationship management and social awareness [20, 21]. These are the elements that we have taught to the students. (ii) Patience – The students may also be frustrated. Allow some time for the students to get through from the experience. Saleebey [22] reminded us that our brains are filled with plasticity that provides “marvelous capacity to alter, extend, and reshape behavior, feeling, and cognition” (p. 11). Students may change their views when they gain more experience and learning. (iii) Have a little faith – A simple belief of “sowing the seeds” works. Against the trend of McUniversity, we may need to pay more effort, but it is worthy!

For me, the experience of teaching “Tomorrow’s leaders” was very precious not only in my pursuit to be a teacher, but also on my understanding of the needs and ideas of the students. This subject opens the door for me to share the aspirations and despair, ups and downs, strengths and weaknesses of the students, which required mutual trust, acceptance and recognition. Engagement of the students, self-disclosure, high but reasonable expectations of the students’ performance, encouragement and acknowledgement of students’ potential are essential keys to break the ice and build up the trust with the students. Though I had been a social worker before who needed to engage well with my clients in the helping process,

engaging the students in the classroom and accompanying with them in their learning was really a refreshing and treasurable experience to me.

Another reflection of teaching “Tomorrow’s leaders” is the personal growth that I have experienced. The theories, activities and videos prepared for every lecture inspired me to have deeper understanding about myself. The resilience of Steve Jobs (1955-2011) in face of hardship, the persistent motive of Nelson Mandela (1918-2013) in building up one nation of different colors, the serving heart of Mother Teresa (1910-1997) for the poor and the neglected etc. not only inspired the students to have a better understanding about themselves, those “great teachers” also encouraged me to be reflective and persistent towards our life goals. Furthermore, during the lecture, I used to share my stories and experiences with the students, on one hand to make the concepts more down-to-earth and related to their daily life, and on the other hand to stimulate the students to reflect more on their own experiences and views. The self-disclosure process involved my consolidation of the past experiences, as well as my self-understanding of my personalities, strengths, weaknesses and competencies. It is not an easy task, but it is essential and valuable for a new teacher.

PERCEIVED BENEFITS OF THE SUBJECT TO THE STUDENTS

Rome was not built in a day. What I expect the students to get from the subject is to start off their search for their purposes of life, and equip themselves towards their goals with competencies, integrity and strengths. The subject employed different evaluative methods to assess the benefits of the students [23-31]. I would like to share some metaphors that my classes have used to describe the subject, as these metaphors represented the meanings of the subject in respect to their learning. Besides the “roller coaster ride” that I have mentioned in the introduction, there were other interesting and “encouraging” metaphors with the students’ explanations:

- Compass – It gives us direction to improve our thinking, and leads us not just be a good leader, but also a good person.
- Rice – I get the “energy” in my leadership! I become stronger and powerful when leading people in the future.
- Painting – It represents different interesting and colorful points of life and displayed its most amazing part.
- Map – The course shows the different roads to me and helps me to identify the ways which I should go.
- Philosopher – The course directs me how to behave in daily life.
- Mirror – The course can let me know more about myself and make myself a better person.
- Rain in Spring and snow in Winter – It moistures the creatures in silence [written in Chinese].
- Pusher – The course pushes us to think, to learn how to be a leader. That’s a good learn[ing] experience and means a lot in my life.
- Coffee – We have gone through some challenging (bitter) times to do our project, but it is a good experience (taste of social science subject).

- Light at the end of the tunnel – It directs my future.
- Water – We are like a seed and need water to help us grow.
- An electric bulb – The course gradually enlightens my awareness of self-understanding. My harvest is the warmth left on it.
- A coffee shop – I feel relaxed and I am free to express what we have learned. We are also free to share our experience with each other.

I was thrilled by the students' creative ideas as well as positive feedback of the subject. From their descriptions, the subject of leadership and intrapersonal qualities has special meanings to the students in four aspects. First, the subject provides insights and directions for the students to search for their life goals. This is especially important for university students as they are the skeleton of the society in the future. Their motivation for further development, as well as the core values (such as moral standards, honesty, integrity) they possess are their "maps" and "compasses" for the attainment of life goals. Second, the subject enhances their self-understanding and self-awareness through reflections. The "mirror" helps them reflect on their strengths and weaknesses and accept themselves as what they are and what they hope to be. Third, the subject provides different learning opportunities for the students to enhance their competencies, like the "rice" to keep them strong and "paintings" that are filled with colors. Last but not least, the subject gives the students a free and secure environment to share their views and ideas, and facilitate mutual learning through collaborations. The "coffee shop" serves as a platform for them to develop their interpersonal competence.

CONCLUSION

Teaching "Tomorrow's leaders" was an exciting and fruitful experience for me, just like having a roller coaster ride. On one hand I needed to equip the students with knowledge on leadership and intrapersonal competence. On the other hand I was a facilitator who sculpted a learning environment for the students to experience and breakthrough. The students went through the different stages of forming, storming, norming and performing. Some gained a wonderful experience and started to search for their life goals, some identified their own strengths and weaknesses and had a better self-understanding, some developed friendship during the team work process and enhanced their social competence, though some remained queried about the need to study leadership in the university. The students may have diverse experiences during the ride.

In facing the growing trend of "McDonaldization" and commercialization of university education, we sometimes may get misted over the missions and objectives of higher education. Tomorrow's Leaders, as a general education subject that emphasizes on the intrapersonal and interpersonal qualities of the students, is a restatement of the importance of holistic development in university education. I am grateful to be one of the participants in the movement. Lastly, I would like to use the verse of Mother Teresa to express my wish of the subject:

“We ourselves feel that what we are doing is just a drop in the ocean...But the ocean would be less because of the missing drop.”

APPENDIX 1. THE METAPHOR DRAWN BY A GROUP OF STUDENTS STUDYING “TOMORROW’S LEADERS”

APPENDIX 2. A SAMPLE OF FEEDBACK TO STUDENTS ON THEIR PRESENTATION

Dear Students,

Thank you very much for your presentation. Your presentation demonstrated your teamwork. We are pleased for the effort that you have made. There are six areas that are commendable:

- 1) Rich content – You gave us many important ingredients in understanding social competence. You have clear description of the tri-component model and further highlighted the model and ways of enhancing social competence with examples. You have done comprehensive literature review and your presentation showed your ability to understand the concepts. Well done!
- 2) Systematic presentation – You presented the definitions, concepts, models, importance and ways of strengthening social competence systematically. Your presentation has a smooth flow and covered as much as you could. A good attempt!
- 3) Use of different means in the presentation – You attempted to use different means to arouse the interests of the students, such as video clippings of Ah Yuen and Obama. This showed your meticulous design of the presentation.

- 4) Good management in the preparation – Your group handed in the work (outline and powerpoint) on time, and you worked independently and effectively in the preparation.
- 5) Effort you have made – You have done good review of the topic and made good slides for the presentation. I believe that your group spent much time in the presentation.
- 6) Group cohesion – It is not easy to work effectively in a group, as everyone is unique and has his/her strengths and weaknesses. Your group performed well and members have had high morale. We observe the group cohesion among the members, and no one has been left out. Keep it up! Friendship is precious.

As a learning process, there are three points that you can improve in the future:

- 1) Engage your classmates – It is important to engage the audience and have some interactions with them. Presentation is a part of communication: You convey the message and at the same time, you need to ask feedback from classmates. What makes the difference from information and message is that whether the respondents capture the essence of it.
- 2) More reflections – Try to include your unique thoughts, feelings and reflections in the presentation. Make the experience a fruitful one with personal reflections.
- 3) Better time management in presentation - I could share the worry to make a good presentation in 30 minutes, with such a rich content. Try to allocate the time more efficiently and be more concise in the presentation in the future.

Sincerely speaking, we are impressed by your intellectual ability and effort, as demonstrated in your presentation. Share the “fruit” of learning together!

Add oil!

Best regards,
Janet

ABSTRACT

University students (N = 32) responded to a 45-item subjective outcome evaluation scale after taking a credit-bearing elective subject titled "Service Leadership" at The Hong Kong Polytechnic University in the second semester of the 2013-14 academic year. Both quantitative and qualitative responses were analyzed to give a comprehensive picture on the students' perceptions of the course. Consistent with previous studies, results showed that students generally had positive perceptions of the subject quality, teaching quality as well as the benefits they gained from the program. There was support for the reliability and validity of the subjective outcome evaluation scale. As predicted, quality of program, instructor and program effectiveness were significantly correlated amongst themselves.

INTRODUCTION

“Serve to learn, learn to serve” is a well-known motto of today’s university education. In the new era of post-industrial and service-driven global economic development, it is necessary to nurture our university students into service leaders beyond the restriction of textbooks—with the mindset and commitment to serving oneself, others and the communities in an ethical manner [1, 2]. In addition, university social responsibility has been an emergent international agenda, which was highlighted in The Second Summit on University Social Responsibility held by The Hong Kong Polytechnic University in November 2014 [3]. The rising demand for qualified young leaders in the service sector provides a good opportunity for universities to promote leadership education through classroom learning and extra-curricular practice as a means to achieve their social responsibility.

A review on the university courses on leadership in different places shows that validated and effective programs are limited, and there are few subjects with the strong focus to promote university students’ understanding, integration and application of the theories, research and concepts of service leadership. Against this background, the Hong Kong Institute of Service Leadership and Management has been pioneering the development of the curriculum of service leadership and management (the SLAM model) in the eight universities in Hong Kong [2]. The aim of the project is to bring a paradigm shift in services and leadership education in Hong Kong and even worldwide [4]. The teaching pedagogy of SLAM grounds on the belief of “the server is the service” as well as the focus on nurturing the character, skills and caring attitude of future service leaders through experiential learning [1].

The classical physics equation “ $E=MC^2$ ” can be used as a metaphor to highlight the three core perspectives of SLAM — an Effective service leader should embrace: a) Moral character, b) generic leadership Competence and c) Caring disposition [2]. $E=MC^2$ is not merely outcome-oriented but also congruent with the process of developing self-understanding, self-leadership and leadership skills of serving and satisfying the needs of oneself, others and society. Moral character refers to one’s sense of morality and development of different character strengths, such as integrity, humanity and traditional Confucian virtues. Generic leadership competence refers to relevant intrapersonal and interpersonal qualities for a successful service leader, such as independent and critical thinking, emotional management, communication skills, conflict resolution and problem solving. Sense of care is also important, which includes respect, loving other people, active listening and empathy for other people.

The Hong Kong Polytechnic University takes a proactive role in adopting the SLAM framework, as well as implementing and evaluating the service leadership courses designed for undergraduate students. “Service Leadership” is an elective credit-bearing subject that has been implemented for four consecutive semesters. The paramount objective of this subject is to promote the service leadership qualities of the students [5]. There are several unique features of the subject. First, instead of following the traditional business-management perspective, the subject emphasizes reflection and promotion of students’ moral character, leadership attributes and caring disposition. Second, experiential learning and interaction between the students and teachers are the major components of the lectures. Students are encouraged to achieve the learning outcomes of understanding, integrating and applying

theories and knowledge of service leadership through group discussion, sharing, project presentation and individual reflective essay. Third, the course serves as an introductory course which provides a good foundation for the students to take another practical service learning course (i.e., Service Leadership through Serving Children and Families with Special Needs) at The Hong Kong Polytechnic University, which is a pioneering attempt in different undergraduate programs [6]. Finally, this subject is characterized by continuous and systematic program evaluation (i.e., objective outcome, subjective outcome evaluation, focus group and qualitative assessments) [5].

Subjective outcome evaluation is an important approach to examine the satisfaction of the students taking the subject as well as the perceived effectiveness of the program [7]. Previous subjective outcome evaluation studies have been conducted to evaluate this subject. Results showed that students were generally satisfied with the subject, implementers and benefits of the program. Besides, the subjective outcome evaluation scale had sound reliability and validity. Perceived program quality and perceived quality of instructors were also significantly associated with program effectiveness and overall satisfaction [8, 9]. As replication is a gold standard in science, there is a need to replicate the positive findings reported previously. As such, this study examined subjective outcome evaluation findings in a new cohort of students.

OUR STUDY

The participants (N=32) were students from different disciplines (i.e., engineering, nursing, design) who took “Service Leadership” in the second semester of the 2013-14 academic year. Students were invited to complete a post-course evaluation questionnaire in the last lecture. Their written consent was all obtained. Enough time was provided for them to answer the questions in a self-administered manner. All the questionnaires were collected and kept strictly confidential. Data cleaning and analyses were conducted by a well-trained post-doctoral fellow.

Instruments

A modified Subjective Outcome Evaluation Scale (SOES) was used in the evaluation. Previous studies showed that this scale possessed adequate psychometric properties [7-9]. The form has five consecutive parts:

1. The Program Content (PC) indicates the perceived quality of the subject in 10 items, such as the objectives of the curriculum, lecture organization, design and implementation of the class activities, and the students’ overall evaluation on the course content (a1 to a10 in Table 1).
2. Program Implementers (PI) includes 10 items as well, which assess the teaching quality (i.e., mastery of the course, preparation, professional attitudes, involvement and caring to the students) perceived by the students (b1 to b10 in Table 2).

3. Program Effectiveness (PE) covers 18 items (c1 to c18 in Table 3), including how students perceive their benefits gained from the course (i.e., development of intrapersonal and interpersonal competencies, improvement in terms of character strengths and caring disposition).
4. Overall Satisfaction (OS) with the program includes 3 items (d1 to d3 in Table 4): a) the extent the students will recommend their friends to take the course; b) their intention to participate in another leadership course; and c) the global satisfaction with the program.
5. Students are also invited to share their additional comments on four open-ended questions (e1 to e4 in Table 5): a) the important things learned from the course; b) the most appreciated things of the course; c) opinions on the lecturers; and d) suggestions for the course development.

To get a comprehensive picture on the students' subjective feelings and perceptions on the subject, all quantitative and qualitative data were analyzed and discussed in this paper.

All data analyses were performed by the statistical package of SPSS 21 (IBM Corp., Armonk, NY, USA). First, the psychometric properties of the SOES were examined in terms of its reliability. Second, as it was expected that different facets of the scale should be inter-related, composite measures of the sub-scales (PC, PI, PE and OS) were created to further test the inter-relationships amongst these variables. Pearson correlation was used to indicate the correlation coefficients amongst the variables. Third, percentages of students' positive rating on each item of the sub-scale as well as their written comments on the overall perceptions of the subject were discussed.

FINDINGS

First, analyses of the sample data showed that the SOES scale had good reliability (see Table 6). Results showed that internal consistency of each sub-scale was all acceptable (above .80): Program Content (Cronbach's alphas = .93; Inter-item correlations = .58), Program Implementers (Cronbach's alphas = .93; Inter-item correlations = .60), Program Effectiveness (Cronbach's alphas = .95; Inter-item correlations = .51), Overall Satisfaction (Cronbach's alphas = .83; Inter-item correlations = .67). As the overall scale and sub-scales were internally consistent, related composite variables were formed.

Second, as predicted, there were significant associations amongst the sub-scales (see Table 7). Pearson correlation analyses showed that there were strong correlations amongst the variables: Program Content and Program Implementers ($r = .87, p < .01$), Program Content and Program Effectiveness ($r = .71, p < .01$), Program Content and Overall Satisfaction ($r = .69, p < .01$), Program Implementers and Program Effectiveness ($r = .68, p < .01$), Program Implementers and Overall Satisfaction ($r = .60, p < .01$), Program Effectiveness and Overall Satisfaction ($r = .63, p < .01$). This observation gives support to the convergent validity of the SOES scale.

Third, the mean scores of different sub-scales could be considered as high: PC (4.12), PI (4.29), PE (3.98) and OS (4.06) which were supported by the percentage findings. In terms of students' perception on the subject (PC, in Table 1), a majority of them enjoyed the experiential and interactive approach of learning, 97% of them appreciated the adequate peer

interaction during the lectures, 91% of them were satisfied with the well-designed activities, and 91% of the students appreciated the overall quality of the course. Regarding the qualitative feedback on the course, students shared that they learned much new knowledge on service leadership. In Table 5, nine out of the 26 positive responses (e1) were related to gaining knowledge in care or caring. Students particularly enjoyed the good interaction with peers and teachers, with 16 out of 27 positive responses (e2) being related to appreciation of good interaction, interactive atmosphere in the class.

Amongst the 10 items of students' perceived quality of instructors, positive responses were over 90% in nine items (PI, in Table 2): 97% of the students appreciated the professional attitude, caring, encouragement and support of the teachers, 94% of them had positive evaluation of the well preparation and teaching skills of the teachers. Linking to the written comments (e3, in Table 5) of the instructors, all valid responses (20 out of 32) were positive. For instance, students wrote, "the lecturers paid so much effort in lessons," "they are well prepared," "keep up the good work, good examples and elaborations," and "giving insights to students."

Besides positive perceptions on quality of the subject and teachers, Table 3 and Table 4 show the percentages of perceived effectiveness of the program (PE) and overall satisfaction (OS), respectively. Roughly 91% of the students agreed that their social competence and self-leadership quality were improved after the course, 88% of them found the course helpful to discover the importance of the proposed framework ($E=MC^2$) of an effective service leader, and 97% of the students had positive evaluations on learning the theories, research and concepts covered in the course. With their positive experiences, 75% of the students indicated their interest to participate in similar leadership courses in the future, and 91% of them would recommend the course to their peers. Overall, 91% of them were satisfied with the course. They also provided many constructive comments on the course (e4, in Table 5), such as providing more practical suggestions for improving leadership skills and using a smaller classroom to facilitate the peer discussion.

DISCUSSION

The study examined the psychometric properties of SOES as well as the effectiveness of "Service Leadership" as a pioneer university subject. In line with the previous studies, the findings of this study demonstrated that SOES had good reliability and validity. As predicted, the total scale and sub-scales were internally consistent and its sub-scales (PC, PI, PE and OS) were significantly associated. As the sample was too small ($N=32$), multiple regression analyses were not performed.

The present findings also showed that a high proportion of the participants had positive evaluations of the course, teachers and perceived benefits to their interpersonal and leadership development. The findings echoed our previous multi-dimensional evaluations on the same subject [10-13]. It is noteworthy that many students gained good knowledge on caring disposition, which is one of the three core elements ($E=MC^2$) in the SLAM model of service leadership. Students learned the importance of caring attitude and providing authentic care to others. In addition, students were satisfied and appreciated the interactive learning and teaching approach, which is one of the uniqueness of the subject—to promote students' self-understanding and acquisition of service leadership knowledge through experiential learning.

Table 1. Summary of the evaluation of the subject (N = 32)

	1		2		3		4		5		Positive response (options 4-5)	
	Strongly disagree		Disagree		Neutral		Agree		Strongly agree			
	N	%	N	%	N	%	N	%	N	%	N	%

c18. The theories, research and concepts covered in the course have helped me synthesize the characteristics of successful service leaders.	0	0	1	3.1	2	6.3	20	62.5	9	28.1	29	91

Table 4. Students' overall satisfaction with the course (N = 32)

	Positive response (options 4-5)	
	N	%
d1. Will you suggest your friends to take this course? ^a	29	91
d2. Will you participate in similar courses again in the future? ^a	24	75
d3. On the whole, are you satisfied with this course? ^b	29	91

Note: ^a 1= Definitely will not, 2 = Will not, 3 = Not sure, 4 = Will, 5 = Definitely will.

^b 1= Very dissatisfied, 2 = Moderately dissatisfied, 3 = Neutral, 4 = Satisfied, 5 = Very satisfied.

Table 5. Summary of students' written comments on the course (N=32)

	Positive responses	Total responses	Percentage	Highlights
e1. The most important thing(s) learned in the course	26	32	81.3%	-"How to take care of others and the importance to take care of others and yourself. Need to give support to others." -"Caring and sharing. Teachers and partners shared their feelings and experiences, then we would give feedback and appreciation to support." -"I learnt that to serve is better than to be served." -"Group interactions and reflection." -"Lots of interaction between students and lecturers." -"Lots of interaction and activities in the lectures." -"Interactive teaching and learning." -"Interactive activities, recap video, music, video, sharing." -"Lots of interaction, demonstrate our knowledge by doing presentation and assignments which is the most effective."
e2. The things that appreciated most in the course	27	32	84.4%	-"The lecturers paid so much effort in lessons (e.g., preparing a gift in the first lesson and a very detailed Power point)." -"They are well prepared." -"Keep up the good work, good examples and elaborations." -"Giving insights to students."
e3. Comments on the lecturer(s)	20	32	62.5%	-"Find another lecture hall, may be a smaller one that would help to discuss with classmates." -"Focus too much on theories, may allow students to practice more." -"Give more suggestions for improving leadership skills. Not only emphasize the importance of service leadership."
e4. Areas for improvement	11	32	34.4%	

Table 6. Means, standard deviations, Cronbach's alphas, and mean inter-item correlations amongst the variables

	Mean	Standard deviation	Cronbach's alpha	Mean inter-item correlations
1. Program Content (PC: 10 items)	4.12	0.54	0.93	0.58
2. Program Implementers (PI: 10 items)	4.29	0.48	0.93	0.60
3. Program Effectiveness (PE: 18 items)	3.98	0.50	0.95	0.51
4. Total Effectiveness (TE: 38 items)	4.10	0.46	0.97	0.47
5. Overall Satisfaction (OS: 3 items)	4.06	0.60	0.83	0.67

Table 7. Correlation coefficients amongst the variables

Variable	1	2	3	4
Program Content (10 items)	-			
Program Implementers (10 items)	.87**	-		
Program Effectiveness (18 items)	.71**	.68**	-	
Total Effectiveness (38 items)	.91**	.89**	.92**	-
Overall Satisfaction (3 items)	.69**	.60**	.63**	.70**

Note: ** $p < .01$.

Overall, the study could make a contribution to the scholarship of service leadership and the leadership programs in the higher education.

Although the present findings are positive, some areas should be further improved in the future studies. First, the sample size of this study was quite small. As such, factor analysis could not be conducted to further explore the dimensionality of the main factors and multiple regression analyses could not be meaningfully conducted. Second, comparison of different findings by using different evaluation methods is preferred. It is necessary to further explore students' critical reflections and narratives on their learning experiences. It is also helpful to integrate evaluation of objective outcome (pre-test and post-test of students' intrapersonal and leadership development) and subjective outcome to enrich the understanding of the overall effectiveness of the subject. Last but not least, with positive feedback on interactive and mutual learning, it will be meaningful to expand the outcome-based evaluation to observe the teacher-student interaction and the exchange and discussion of some new ideas on service leadership throughout the subject.

ACKNOWLEDGMENTS

The preparation for this paper was financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

ABSTRACT

A subject entitled "Tomorrow's Leaders" aiming at promoting the holistic development of university students was offered to students at The Hong Kong Polytechnic University. Toward the end of the term, students were invited to give descriptors and metaphors about the subject. Based on the written narratives of 1,029 students, it was observed that most students used positive descriptors to describe the subject. Concerning the metaphors that could stand for the subject, most of the metaphors are positive in nature. Reliability analyses based on randomly selected coded responses showed that intra- and inter-rater reliabilities were high. In conjunction with other

evaluation findings, the present study suggests that this subject was able to promote the holistic development in Chinese university students in Hong Kong.

INTRODUCTION

The quantitative-qualitative methodology debate appears to be everlasting in the field of evaluation [1-10]. On the one hand, some researchers argued that quantitative and qualitative evaluation methods cannot be combined because they have different axiological and paradigmatic considerations [11, 12]. According to Denzin and Lincoln [11], “[c]ommensurability is an issue only when researchers want to ‘pick and choose’ among the axioms of positivist and interpretivist models, because the axioms are contradictory and mutually exclusive” (p. 117). On the other hand, there are theorists arguing that both quantitative and qualitative methods are compatible for any evaluation research with reference to specific conditions of practice [13-16]. Besides, the concept “methodological appropriateness” has been coined [13, 14, 17, 18]. According to Patton [17], methodological appropriateness was defined as “matching the evaluation design to the evaluation situation taking into account the priority questions and intended uses of primary intended users, the costs and benefits of alternative designs, the decisions that are to be made, the level of evidence necessary to support those decisions, ethical considerations, and utility” (p. 460). Patton [17] further proposed eight developments contributing to the feasibility of methodological appropriateness. For example, there is a growing consensus on interdisciplinary and multi-method approaches to evaluation.

With specific reference to the recent discussions of paradigms in the field evaluation, there are three main paradigms. They are post-positivism, constructivism and related perspectives, and pragmatism [17, 19-21]. For example, Alkin [19] pointed out that the goal of post-positivistic research is trying to measure universal truth and its causal relationships amongst variables, although a perfect understanding of the truth cannot be achieved because of various observational errors. Constructionists, however, do not believe in one single truth; there are many truths that are relative to one’s cultural and historical experiences. Relationships are also interdependent and thus no linear causal relationship can be found. Hence, observational biases need not be controlled but acknowledged. Moreover, the pursuit of local relevant findings is more appreciated than searching for universal truth. Pragmatists, like constructionists, also believe in no one single truth but one explanation of reality can be regarded “truer” than the other at a given timeframe; they also believe in causal relationships, like post-positivists, but in a more sophisticated manner [21, 22].

Besides the choice of paradigm in evaluation, it is also important to consider which method is suitable to be used under what conditions. In fact, a review of literature in educational evaluation has also shown that many approaches and models are available for various uses. First, House [23] proposed various evaluation models such as the utilitarian and intuitionist/pluralist perspectives. Second, Worthen and Sanders [24] classified six alternative approaches to educational evaluation. They are objectives-oriented, management-oriented, consumer-oriented, expertise-oriented, adversary-oriented, as well as naturalistic and participant-oriented approaches. Third, Scriven [25] suggested another six types of evaluation approaches, including strong decision support view, weak decision support view, relativistic view, rich description approach, social process school, and constructivist approach. Fourth,

Stufflebeam, Madaus, and Kellaghan [26] analyzed twenty-two program evaluation approaches to identify which approach is the worthiest one to be applied under certain conditions. Fifth, Cousins and Ryan [27] suggested four ongoing issues for educational evaluation, including evidence-based policy and programming, performance measurement, auditing and monitoring, learning and discovery-oriented evaluation, and values-oriented evaluation.

In the context of higher education, many approaches have similarly been used to assess the effectiveness of courses and programs. Amongst the various approaches that have been adopted, it is common to conduct mandatory course evaluation (i.e., subjective outcome evaluation) at the end of the semester [28]. As a means of obtaining information about the strengths and weaknesses of a course and to make instructional and administrative decision [29], course evaluation usually takes the form of a series of ubiquitous Likert scales [28, 30, 31]. Although course evaluation is an efficient way to gauge the views of the students, it might not be able to reflect the complexity of the subjective learning experiences [32]. Starr-Glass [28] regarded course evaluation based on the questionnaire approach “fail[ing] to capture the quintessential dimensions of learning engagement” (p. 198). Parlett and Hamilton [33] commented that many formal evaluations present “an emaciated and artificial picture of real education life” (p. 16). In order to address these criticisms, it is argued that qualitative evaluation methods could give some additional information on the merits and effectiveness of a course.

There are many qualitative evaluation approaches and methods [13, 14, 34, 35], such as focus groups, interviews and written reflections. In this study, qualitative data in the form of written descriptors and metaphors were collected to understand the perceived benefits of a subject. The concept of metaphor has been emphasized in the field of educational evaluation [14, 36-39]. Metaphors are used in everyday communication and they can be regarded as good representations of realities [40]. Metaphor has been conceived as a fundamental vehicle that people use to understand, express, construct and organize their world [39-42]. It provides insights for new perspectives and innovation [39], helps people to explain unknown experiences by known one [42], serves as a convenient way to communicate a complex idea [43], describes important features of a complex array variables in a simple form [44], transmits a complete story using simple images [45], and offers dynamic and dramatic views beyond the surface of things and reveals their deeper significance [46].

In terms of conceptualization of metaphor as an analogy, metaphor is defined as an analogy that imaginatively identifies one object with another [47] and as an analog device that serves as a means for framing and defining experiences [48]. Yob [49] further explained that metaphor is employed when one wants to explore and understand something esoteric, abstract, novel or highly speculative.

In the domain of education research, Martinez, Saulea and Huber [50] argued that teaching and learning could be addressed from three major perspectives. The first one is the behaviorist/empiricist perspective. This perspective regards the learner as passive and knowledge is developed by forming associations and by subdivision of learning tasks into small and logically sequenced components. Under this perspective, teachers may be treated as transmitters of information whereas learners as passive recipients in metaphors. The second one is the cognitive/constructivist perspective. This perspective regards development of knowledge as actively constructed by the learner through transforming the old schema into a new one. Under this perspective, teachers may be treated as facilitators of information

whereas learners as active agents of the learning process in metaphors. The third one is the situational/socio-historical perspective. Under this perspective, learning is situated in the social context in which it is constructed. Knowledge is a by-product of the activity, context, and culture in which it is used. Classifying metaphors of teaching and learning into three major dimensions provides a basic conceptual framework to understand the educational beliefs of the teachers and students.

Concerning the meaning of metaphor in the field of education evaluation, Madaus and Kellaghan [51] argued that metaphors “influence the way we understand and talk about education; they create mind-sets and influence behavior toward school and teachers; they also influence the kinds of questions we ask about educational programs”. Results of related research indicate that metaphor is able to illustrate diversified and authentic understanding of the respondents [28, 32, 52, 53]. Alvesson [54] further suggested that a sophisticated use of metaphor can “facilitates offering various comprehensive images of research, thus reducing the risk of latching on to a one-sided and favourite conception”. However, Alvesson [54] also stated that “we can think in contradiction to our favored metaphors and not just deviate from the thinking they encourage in those exceptional cases where they clearly don’t work”. This reminder of using metaphor is also shared by other scholars [55, 56].

Nevertheless, the use of metaphor in education contexts does contain drawbacks [57]. First, metaphors have a constrained conceptual framework because the assumptions and predispositions reflected by the metaphors can only related to the phenomena the author intends to cover [56]. Second, metaphors may create distortions because metaphors create “a way of seeing” and “ways of not seeing” at the same time [55]. Despite these limitations, research shows that there are several merits of using metaphors in education contexts [57]. First, metaphors provide coherent and internal consistent information that gives insights into implicit ideas. Second, metaphors are evocative and stimulating for people to tease out connections that might not be made use of by direct questions [57]. Third, metaphors synthesize a large amount of knowledge about teachers, learners and teaching methods [58]. Fourth, metaphors serve as tools for teachers to gain distances from their own practices and to act as external observers reviewing their teaching. Fifth, metaphors make implicit knowledge explicit through reflection on and representation of the concepts. Sixth, metaphors give a language that can connect theory and practices. Seventh, metaphors empower teachers to examine their own assumptions and to explore hidden intellectual avenues [59]. Finally, metaphors reflect upon alternative teaching practices and theoretical frameworks [57].

Given the fact that metaphors and related concepts like descriptors have many strengths, metaphors play a central role in conceptualizing and reflecting upon the nature of teaching and learning [57] and they have been used as tools to evaluate education programs. For instance, to evaluate a distance-learning course in business and economics at the undergraduate level, Starr-Glass [28] asked the students to provide semantic indicators and metaphors and found that the course was promoting independent thoughts, consideration and reflection. In addition, with the use of semantic indicators and metaphors, Starr-Glass [28] identified “a great of ostensibly significant and authentic emotional engagement with the course” (p. 205). Thomas and Beauchamp [32] used metaphors in semi-structured interviews to explore the learning experiences of newly graduated teachers in terms of their professional identity. Newly graduated teachers were interviewed immediately after graduation of their teacher education programs and after their first year of teaching. The participants were asked

to create their own metaphors on teaching experiences. The metaphors were coded using NVivo. The findings indicated that the new teachers struggled to develop their professional identity during their first year, and that this development process was gradual, complex and often problematic. Research also examined how metaphors revealed changes of pre-service elementary teachers' beliefs about learning and teaching. The factors contributing to the changes of pre-service elementary teachers' beliefs were also examined [57].

Finally, Levin and Wagner [52] also used metaphors to explore eighth grade students' views on writing in science classrooms. They divided 97 eighth graders into intervention classes and comparative classes. In the intervention classes, students were assigned to complete informal reflective writing tasks whereas the students in comparative classes were not required to write anything. At the end of the teaching units, all students were required to submit two final reflective writings. Levin and Wagner [52] analyzed the students' writing and found that the students in the intervention group expressed emotional dimension less than the students in the comparative group. The students in the intervention group expressed the social dimension more than the students in the comparative group. Levin and Wagner [52] further analyzed the contents of the reflective writing. The results showed that the writing-to-learn task, feedback and reflective writing greatly influenced students' views on writing.

Although research utilizing metaphors and related descriptors is available in education evaluation research, studies focusing on learning experiences from students' perspective at university education setting were limited. A computer search of PsycINFO in March 2014 using the search terms of "metaphor", "university education" and "evaluation" showed that there were 52 citations. A similar survey of Social Sciences Citation Index using the same search terms only located 3 citations. If adding "descriptor" as a search term, no citation was found. These figures imply that there are only few studies using metaphors and descriptors to understand the subjective learning experiences from students' perspectives, especially in the Chinese context [60]. To fill this research gap, the present study intended to explore the views of university students on a subject on leadership and intrapersonal development using metaphors and descriptors.

To promote holistic development of university students and address community concern about young people [61], a general university requirements subject titled "Tomorrow's Leaders" was offered at The Hong Kong Polytechnic University to cultivate various intra- and inter-personal competences of students. Through lectures, experiential learning, group presentation and individual assignments, students were nurtured on their self-understanding, personality, emotional competence, cognitive competence, resilience, spirituality, social competence, moral competence, positive identity, interpersonal communication, conflict resolution, team-building, and relationship-building.

In the pilot phase, research indicated the effectiveness of the course by several evaluation strategies. These included: a) pretest/post-test questionnaires using the Chinese Positive Youth Development Scale to examine changes in intra- and inter-personal qualities in students [62], b) subjective outcome evaluation at the end of each lecture, c) post-course subjective outcome evaluation conducted at the end of the whole course [63], d) process evaluation via systematic observation [64], e) focus group interview for students' views on their learning experiences [65], and f) descriptors and metaphors about the students' feelings and perception of the course in a reflection sheet. Based on the data collected in the formal

implementation phase, the objective of this study was to evaluate the subject based on the descriptors and metaphors written by the students.

OUR STUDY

Sixteen classes of students took this course, with a total enrollment of 1,029 students (57 in Class A, 52 in Class B, 58 in Class C, 70 in Class D, 59 in Class E, 55 in Class F, 83 in Class G, 66 in Class H, 84 in Class I, 73 in Class J, 91 in Class K, 72 in Class L, 56 in Class M, 58 in Class N, 52 in Class O and 43 in Class P). At the end of the course, the personal reflection forms were given to the students in which they were invited to fill in two parts. In the first part, students were invited to use three words or phrases to describe their feelings, perceptions and experiences about taking this subject (i.e., descriptors of this course). In the second part, students were invited to think about a metaphor which could stand for the course and give some explanations about the meaning of the metaphor. The metaphor may be an object, an event or a state (e.g., a wonderful journey, a seed or a book).

Data Analyses

A total of 633 personal reflection forms were collected from the students. Their responses in the reflection form were entered in the computer for analyses. Four researchers were involved in the data analysis process. Two research assistants were responsible for the “descriptor” part and the other two were responsible for the “metaphor” part. A meaningful unit was used as the basic unit of analysis. For instance, the statement that a course was “wonderful and relaxing” was broken into two meaningful units, namely “wonderful” and “relaxing”. On the other hand, descriptions with the same meaning (e.g., “relaxed” and “relaxing”) were grouped into the same attribute category. Regarding the positivity of the codes, four possible codes were involved, including positive codes, negative codes, neutral codes and undecided codes. A total of 1,881 descriptors and 613 metaphors were coded and analyzed.

According to Miles and Huberman [66], check-coding facilitated definitional clarity and it also served as a good reliability check. Check-coding becomes sharper when two researchers code the same data set and discuss their initial difficulties. To enhance the reliability of the coding on the positivity nature of the raw codes, both intra- and inter-rater reliabilities were conducted. Regarding the first part (i.e., descriptors), 40 randomly selected descriptors were re-coded among the two researchers to check for the intra-rater reliability. Regarding the inter-rater reliability, 40 randomly selected descriptors were also re-coded among the other two researchers who did not involve in the initial coding process.

Regarding the second part (i.e., metaphors), 40 randomly selected metaphors were re-coded among the two researchers to check for the intra-rater reliability. With a view to check for the inter-rater reliability, 40 randomly selected metaphors were also recoded among the two researchers who were not involved in the initial coding process. The raw data files and

steps involved in the development of coding system were properly documented and systematically organized.

Table 1. Categorization of descriptors to describe the course

Descriptors	Nature of the responses				Total
	Positive	Neutral	Negative	Undecided	
Comprehensive	44				44

FINDINGS

Qualitative findings on two areas are presented as follows: (a) descriptors that were used by the participants to describe the program; and (b) metaphors (objects, occasions, feelings) that were used by the participants to portray the program. The descriptors that the participants used to describe the program are presented in Table 1. There were 1,881 raw descriptors in total, which could be further classified into different classifications.

Table 4. Illustrations of metaphors coded as negative

1.	Boring
2.	Bitter
3.	Process is hard
4.	Theories are not attractive
5.	Boring and dull
6.	Bitter at first
7.	Demanding workload
8.	Don't find my way in the first lecture
9.	Intangible
10.	Annoying
11.	Appearance is not attractive
12.	Boring lectures
13.	It is not yummy
14.	Difficult in project part
15.	Difficult to apply in daily life
16.	Do not want to do it at the beginning
17.	I did not learn anything
18.	It is not an interesting subject
19.	Long lecture hour
20.	Many concepts but they are difficult to understand
21.	Mysterious
22.	Not attractive
23.	It is not easy to learn those concepts and search for the eggs
24.	It is not helpful to me
25.	It is not useful to me
26.	Quite confusing
27.	I can't understand the concepts
28.	It takes short time to master them
29.	Students have chances to do reflection in class but they simply don't have the initiative to do so
30.	The subject on the whole is quite time-consuming as well as its assignment and projects
31.	Topics are not connected
32.	Useless

Among all of the descriptors, 1,745 (92.8%) of them were positive responses, 67 (3.6%) of them were negative responses (see Table 2), 46 (2.5%) of them were classified as neutral responses and 23 (1.2%) of them were undecided. It was found that the participants used "boring", "demanding", "long lesson", "useless", "abstract" to describe most of the negative responses, while the remaining responses were classified as other negative responses. Eighty raw descriptors were randomly selected for the calculation of the reliability tests. The intra-rater reliability was 100% whilst the inter-rater reliability was 95%.

The categorization of metaphors written by the participants is shown in Table 3. There were 613 raw metaphors which could be further categorized into different categories. Among the responses, 569 (92.8%) of them were positive responses while 10 (1.6%) of them were negative responses. The description for the negative responses can be seen in Table 4. Results revealed that participants used different expressions to describe the program, with most using “mirror” as the metaphor. Some participants used “journey”, “compass”, “light” and “water and sun” to describe the program. Eighty raw metaphors were randomly selected for the calculation of intra- and inter-rater reliabilities of the coding. The related values were 95% and 92.5%, respectively.

DISCUSSION

Based on the qualitative data on the descriptors and metaphors collected from students, the present study investigated perceptions of students of “Tomorrow’s Leaders”, a credit-bearing course enhancing holistic development of the students at The Hong Kong Polytechnic University, in the full implementation stage. There were several distinctive features of the present study. First, the present study provided a qualitative evaluation on the subjective learning experiences of the students based on metaphors and descriptors. As there are few related studies in this area, this study fills the research gap in this area. Second, this study demonstrated how qualitative data of the metaphors and descriptors from students supplemented quantitative course evaluation using ubiquitous Likert scales. Unlike numbers and statistics, the metaphors and descriptors showed complexity of the subjective learning experiences of the students [32]. Third, a large sample was used in this study. This is unique because the sample size in qualitative studies is usually small.

This study provided evidence supporting the positive impacts and effectiveness of “Tomorrow’s Leaders” based on qualitative data on the subjective experiences of the students. Two salient conclusions can be drawn from the present study. First, students perceived the course positively. Roughly nine-tenth of the responses in the descriptors and metaphors were positive (see Tables 1 and 3). For example, the students described the course as “interesting”, “inspiring” and “useful” according to the descriptors collected (see Table 3). Most of the negative responses were related to the views that the course was boring and academically demanding. Although the negative responses accounted for only 3.6% of the responses, this information was useful for further improvement of the course. Another observation was that some negative responses were contradictory in nature. For instance, some students reported that the lecture time was too long whereas some regarded that the lecture was too short for them to master the knowledge.

The positive feedback obtained in this study is consistent with other evaluation studies based on different methods [60, 62-65, 67-73]. For instance, objective outcome evaluation findings showed that students had positive changes in intra- and inter-personal competences after taking the course [62]. In addition, both subjective outcome evaluation at the end of each lecture and post-course subjective outcome evaluation showed that students had positive perception of the program, implementers and effectiveness [63, 71]. Process evaluation via systematic observation also showed that the program had high program adherence [68]. In

sum, research findings in different studies suggested that the course brought positive impacts on students for their holistic development and students had positive views on the course.

Nevertheless, although positive feedback was documented among focus groups, alternative explanations should be acknowledged [74]. First, positive responses from students might be due to demand characteristics. However, this explanation was not plausible because students freely gave their responses and negative comments were noted. In addition, the identity of the students was not revealed in their submission. Second, favorable results might be explained by researchers' preoccupations about positive evaluation outcomes. However, intra- and inter-rater reliabilities as well as disciplined data analyses were performed to reduce possible biases in data collection and analyses.

While the findings are positive, it should be noted that the present study faced several limitations. First, metaphors and descriptors from students were collected toward the end of the course. It would be illuminating if data could be collected at different time points (e.g., mid-term evaluation). Second, in addition to metaphors and descriptors, in-depth individual interviews of both students and teachers could be attempted. This can allow researchers to understand the subjective experiences in different stakeholders. Finally, due to practical and time constraints, peer-checking and member checking were not carried out. It would be desirable to add such feedback mechanisms in future. Despite these limitations, the present study provides qualitative findings to support the positive features and effectiveness of the course "Tomorrow's Leaders" and its effectiveness from the perspective of the students.

ACKNOWLEDGMENTS

The preparation for this paper was financially supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. This chapter is based on an article previously published in the *International Journal on Disability and Human Development* 2016;15(2) issue.

ABSTRACT

In this chapter, five focus groups involving 30 students were conducted to evaluate a subject entitled "Tomorrow's Leaders", which was designed to promote the leadership and intrapersonal competence of university students under the new four-year undergraduate curriculum at The Hong Kong Polytechnic University. Four major themes could be highlighted from the narratives of the participants. First, the students generally had positive perceptions of the subject and the learning process, and positive features of the subject and related experiences were also identified. Second, the students pointed out that they had personal gains and positive changes after taking this subject. Third, the students generally felt that there was a need for this subject. Finally, the students mentioned some negative aspects of the subject and they proposed some suggestions for the refinement of the subject. Overall speaking, the qualitative findings suggest that the students had positive views about the subject and they experienced the benefits of taking this subject.

INTRODUCTION

In the field of evaluation, many different approaches have been proposed. For those who believe in the natural science models, experimental evaluation strategies such as clinical trials and quasi-experimental studies have been used. Actually, findings based on randomized controlled trials are usually regarded as the “gold standard”. However, experimental and quantitative approaches to evaluation have been criticized as superficial which cannot give any in-depth inquisition of the experiences of the program participants in the process. Hence, in contrast to the quantitative and experimental approaches, researchers have argued for the use of qualitative evaluation methods to examine the meaning of a program to its participants and the related program effects. Patton [1] pointed out that qualitative evaluation would be desirable if the evaluator wishes to look at individualized outcomes and internal processes of a program. Besides, the quest for in-depth and descriptive information, diverse and unique views of the stakeholders, and new insights from human interactions would motivate one to adopt qualitative evaluation methods. Finally, if an evaluator wishes to be humanistic and personal and these are the ideological principles to be maintained, qualitative evaluation should be used. The qualitative research is therefore attempting to “make sense of, or interpret, phenomena in terms of the meanings people bring to them” [2].

There are different strategies and data collection methods in qualitative research, such as interviews, observations, and textual analyses [2]. Amongst these methods, focus groups are commonly used in the context of evaluation. Focus group interview is a qualitative research method which assesses clients’ opinions and program quality in different fields, including mass communication and public opinion [3], education and psychology [4], and health settings [5]. According to Kamberelis and Dimitriadis [6], “focus group research is a key site where pedagogy, politics, and inquiry intersect and interanimate each other. Because of their synergistic potentials, focus groups often produce data that are seldom produced through individual interviewing and observation and thus yield particularly powerful knowledge and insights” (p. 559).

The advantages of adopting focus group interviews include cost-effectiveness in data collection [7, 8], allowing interactions among group participants that stimulate a fruitful exchange of ideas [4, 9], and enhancing data quality by checks and balances of the ideas shared by one another [10]. A wide range of perspectives on the research issues could be sought and some cultural-specific or community-specific norms or practices could also be identified in the group environment. Despite the advantages of using focus group interviews in exploring the depth of the research issues, various experienced qualitative researchers highlighted some methodological issues in doing qualitative research [2, 7, 10, 11]. First, the response time available for each participant is limited because of the presence of other members in the group. Second, a skillful moderator is required to facilitate a fair and free-eliciting communication environment. Third, issue of confidentiality can hardly be guaranteed in focus group settings because of the involvement of many people. Fourth, the focus group interviews are conducted in an arranged setting and thus the interactions among participants may not be as natural as usual.

Despite the wide use of focus group interviews in social science research, there are few studies using this method as an evaluation method in higher education settings [12-14]. Only 22 citations were found based on a survey of PsycINFO in March 2014 when “focus group”,

“university education” or “college students” were used as keywords. A similar search of Social Sciences Citation Index using the same keywords only located 37 citations. These two searches also indicated that there were limited focus group evaluation studies in Chinese populations [14]. Recently, there are views suggesting that evaluators should use more focus groups in higher education contexts [15-22]. With specific reference to Hong Kong, Shek and Sun [14] used focus group interviews as an evaluation methodology for a general education course. The use of focus group interviews aids the researchers to obtain a community-specific (i.e., the students who have attended the general education course) perceptions of the course contents, lecturers, and the learning process. The results showed that there were personal gains and positive changes in students after taking the course. The students also voiced out the urgent need for similar courses in university settings.

Concerning university students in Hong Kong, Shek and Wong [23] identified several problems, including high level of mental distress, low social responsibility, drop in empathy, rising narcissistic personalities, and lower level of maturity. To respond to the needs of Hong Kong university students utilizing a holistic development approach, the first author developed and offered a subject entitled “Tomorrow’s Leaders” to cultivate various intra- and interpersonal competences of students under the General University Requirements at The Hong Kong Polytechnic University. Concepts of self-understanding, personality, emotional competence, cognitive competence, resilience, spirituality, social competence, moral competence, positive identity, interpersonal communication, conflict resolution, team-building, and relationship-building are covered in this course. It is expected that students can learn these concepts through lectures, experiential learning, group presentation, and individual assignment, and apply them in their daily life.

There are several studies showing the effectiveness of this course in the pilot stage. These studies used several evaluation strategies including a) a pre-test/post-test design using the Chinese Positive Youth Development Scale to examine changes in intra- and interpersonal qualities in students, b) subjective outcome evaluation at the end of each lecture, c) post-course subjective outcome evaluation at the end of the whole course, d) process evaluation via systematic observation, e) focus group interviews for gathering students’ view on their learning experiences, f) descriptors and metaphors from students about their feelings toward the course, and g) students’ perception of the course written on a reflection sheet [14, 24-37]. Taken as a whole, the evaluation findings were very positive, suggesting that the subject was well-received by the students and students generally felt that they benefitted from the course. Bloor et al. [38] suggested that the findings of focus group interviews can be mixed with that of other evaluation methods which can generate a triangulated picture. The triangulated picture generated from the existing evaluation studies generally showed that the subject could promote the holistic development of the students. To further understand the impacts of the subject on the students, this paper reports evaluation findings of the course “Tomorrow’s Leaders” in its full implementation stage based on focus group data. Translated excerpts (originally in Cantonese and Putonghua) of the focus group interviews would also be presented to support the findings.

OUR STUDY

Sixteen classes of students took this course, with a total enrolment of 1,029 students (57 in Class A, 52 in Class B, 58 in Class C, 70 in Class D, 59 in Class E, 55 in Class F, 83 in Class G, 66 in Class H, 84 in Class I, 73 in Class J, 91 in Class K, 72 in Class L, 56 in Class M, 58 in Class N, 52 in Class O, and 43 in Class P). After the completion of the subject, local and non-local students were asked to participate in focus group interviews. Five focus groups were conducted as follows: Group 1 (8 local students), Group 2 (4 local students), Group 3 (7 local students), Group 4 (6 local students), and Group 5 (5 non-local students). All of the interviews were audio-taped, transcribed, and then checked for accuracy in transcription.

Instruments

To conduct the focus group interviews, a semi-structured interview guide based on the CIPP evaluation model (Context, Input, Process, Product) developed by Stufflebeam [39] was used. The CIPP model provides a systematic way of looking at different aspects of the curriculum development process as well as outcomes. Based on the CIPP model [39], questions about the context, input, process and product were asked. About context evaluation, questions on the difference between “Tomorrow’s Leaders” and other courses, and whether the students thought the existing university education was able to help them develop in a holistic manner were asked. For input evaluation, questions on whether the subject matter was difficult and how much time the students put into the course were asked. For process evaluation, questions on their views of the subject and the teaching/learning process were asked. Finally students were asked about the changes they had after taking this course.

Based on these questions, the data were collected and analyzed with reference to the following domains: (a) positive comments about the subject, class, and the lecturers; (b) benefits that students thought the subject had brought to them; (c) negative comments about the subject; (d) whether there was a need to have this subject; and (e) suggestions for future improvement. For the data analyses, broad themes related to the above domains were extracted to give a general picture of the process and outcomes of the evaluation. The analyses were discussed and reviewed by the researchers.

FINDINGS

Based on the results of thematic analyses, four major conclusions could be drawn from the focus group interview data.

Conclusion 1: Students Had Positive Perceptions of the Subject, Learning Process, Features of the Subject and Related Learning Experiences

Generally speaking, students had positive perceptions toward the nature, content, and lecturers of the subject. The students liked the experiential learning activities. They thought

the activities did help them gain the knowledge and understand themselves better, as shown in the following narratives.

- “It (“Tomorrow’s Leaders”) provided varied activities that enhanced discussions among group mates with the relevant topics. Comparing with other lectures that conducted in merely lecturing, this subject allowed students to interact more.”
- “Playing this game allowed us to discover our own ‘blind spots’ in interpersonal communication. The use of activities could help us understand the theories better than reading papers by ourselves which is quite time-consuming.”
- “I think the contents were good because the leadership skills focused in this subject were related to the self-level, like self-awareness and self-improvement. These were excellent contents.”
- “This subject related to our daily life and future career much, like teaching us the ways to cope with life challenges. ‘Tomorrow’s Leaders’ was an all-rounded subject.”

The students also showed their appreciation of the lecturers. They were impressed by the flexible and unique teaching methods of the lecturers. Some narratives are as follows:

- “We could not understand the content well at first. The lecturer then tried to change her teaching style by adding more daily examples. This fostered our understanding of the theories.”
- “Sometimes it was boring when the lecturer was talking about the theories. However, the lecturer would walk around the lecture hall to ensure the learning progress of the students, which also attracted our attention to the lectures.”
- “Our lecturer would conduct her lecture in a research format that helped explaining the related issues to students.”
- “What our lecturer did very well was that she would go to every group to see if we were on the right track and gave us suggestions. She would share our ideas to the class and we could gain insights from different views. One more thing was that she could remember all of our names. She was awesome.”

Furthermore, students thought they had more in-depth reflection and gained a higher level of self-awareness from the learning process in this subject.

- “I thought leadership is just a kind of entrepreneurship or virtues at first. Never could I imagine that leadership can be related to different issues before the lecturer linked them up together. This linkage helps me to think comprehensively and deepens my memories.”
- “This subject really made me reflect on myself. The videos (one of the teaching tools) triggered me to have self-reflection and think of ways to equip myself to be a better person.”
- “I was so impressed by the activity about resilience. We had to write a sentence, draw a picture, and grab the candies on the table without using our hands. I suddenly

realized that we would have restrictions without our hands. It was a good experience for us to practice alternative solutions when encountering obstacles.”

- “The subject provided us with lots of opportunities for self-detection, and we can understand ourselves better.”

Conclusion 2: Students Had Personal Gains and Positive Changes after Taking the Subject

Students perceived the subject was able to facilitate their reflection on themselves, thinking about the meaning of life, and thus enhancing their self-understanding and thinking in a more positive way.

- “I think the subject facilitated my in-depth thinking through an academic perspective, which is different from the understanding only based on common sense.”
- “This subject reminds us of a very important thing: in addition to study, it is also important to nurture our own qualities.”
- “When there is a problem or a moment of feeling bad, I learned how to relieve myself.”
- “The subject provides a learning process in which we are able to reflect about ourselves seriously. For example, by writing the term paper, we could recall and reorganize our life experiences seriously. This is not imagination but self-reflection. Therefore, I think the term paper is useful for us!”
- “It makes me being even more attentive to my social skills, such as communication skills I will, throughout the entire [life] process, reflect myself constantly.”
- “I also think ‘Tomorrow’s Leaders’ is a subject different from the other subjects. Other subjects focus on instilling academic information into students. ‘Tomorrow’s Leaders’, however, provides us with many opportunities for self-reflection, which makes students understand themselves more. In my opinion, studying in the university is not only for the pursuit of academic knowledge, but also for self-understanding.”
- “I always carried out many reflections about myself on the way home after classes of ‘Tomorrow’s Leaders’. Therefore, this subject provides a very strong message to me, and that is reflection.”

Some students further stated that the subject has cultivated their competences, such as cognitive competence.

- “After the game had finished, I felt enlightened—the original idea [in head] did not work in fact. This was a very memorable experience for me!”
- “This subject is very useful for me, which changed my mode of thinking. I am now able to think with reference to situational needs.”
- “We now have a different approach to deal with various issues in life.”

Besides, students mentioned that the subject has provided an opportunity for them to learn how to work together.

- “‘Tomorrow’s Leaders’ provided many opportunities for us to make friends with classmates. As such, students were able to get to know one another through the class activities. Hence, the subject can encourage us to be more involved in those class activities, and we thus actively participated in the entire process.”
- “There was much interaction during classes. Apart from making friends with classmates, I also understood the importance of listening to others’ ideas. No one can always be right. I have also recognized the ways of effective collaboration.”
- “This subject can help us understand how our personality can be developed, or how to get a job done better. This is also a subject about team-building. So I agree that, in most of the situations, the contents covered in this subject should be very useful to our daily life.”
- “This subject is useful to a certain extent. I have learned some communication skills. As there are many group projects throughout the university learning life, the experiences in this subject [of doing projects] can act as a reference for communicating with others in a better way, especially in dealing of interpersonal issues.”

Conclusion 3: Student Felt That There Was a Need for This Subject

Generally speaking, the students perceived the subject to be essential to their transition to the university life.

- “I think this subject is suitable for freshmen in their first semester. There was full of interactions in the subject, which allowed students within the same faculty interacting with each other. The students in the same group knew each other quite well and would take care of one another. I believe all these experiences are helpful to our learning in future.”
- “The subjects I am studying [in the university] are mostly science courses. I think the provision of subjects by the University like ‘Tomorrow’s Leaders’ is good for the holistic development of students. It does not only broaden the horizon of the students, but also facilitates their intrapersonal development.”
- “I think it is fine to keep the subject that provides a bridge [with others] for those who are passive in their university life.”
- “I think it is like a ‘bridging class’ for freshmen if they could enroll the subject in the first semester as the university or even Hong Kong might be a totally new environment for freshmen. There is a need of adaptation. The subject does play a role in this adaptation process.”

Moreover, the students stated that the subject was able to prepare them for a better performance now and in the future.

- “I think the rationale of this subject is very good to include the topics of emotional management, self-awareness issues, self-reflection, and self-improvement. I think these ideas are very good and necessary.”
- “I think the subject is helpful. As I said earlier, although you learned some theories, you may not be aware of how the theories, such as team building and personality, can be utilized in the daily life. The subject is thus able to facilitate students' self-understanding, enhance their self-confidence, and even change their lifestyle.”
- “I think one of learning outcomes of the subject is to facilitate your competence of interpersonal communication, which should be a must for undergraduates.”
- “The subject is necessary for our preparation for entering the society. It is because we need to deal with people with different background, which requires a better self-understanding, emotional control, and even being empathetic to others.”

Conclusion 4: Students Mentioned Some Negative Aspects of the Subject and Proposed Suggestions to Overcome Them

Apart from the positive comments and personal benefits, there are narratives on the negative aspects of the subject. First, some students remarked that there were too many theories in the course and the theories were quite difficult to understand. One student remarked, “Most of the theories are related to psychology but I am not from the social sciences stream. So it is quite hard for me to understand the concepts.” Another student said, “I found that the theories were quite difficult for me to understand even though I have read through the journals from the required readings.” A student suggested that more practical opportunities should be given, “There should be more opportunities for us to practice what we have learned about leadership in real life situations.”

Second, some students found that the class started too early in the morning. A student remarked, “The class started at 8:30 am. Even though the activities were very interesting, we were too sleepy to participate much in the activities.”

In addition, other negative comments were heard. These included: (a) some group members were not involved; (b) there were difficulties in the group presentations and individual assignment; (c) there was a comparatively heavy workload; (d) the lecture time was long (three hours lecture).

With respect to the above negative aspects of the subject, there were several suggestions for improvement from the students. Some narratives are illustrated as follows:

- “The lecturers could use more real life examples or conduct more in-class activities to illustrate those abstract and difficult concepts.”
- “There are too many students from different disciplines in a group. There were seven students in my group. The number of students should be set at four to five in each group.”
- “There could be more breaks because the lecture began too early in the morning and the duration of the lecture was too long.”

- “The guidelines for the group presentation and the individual paper could be explained more clearly so that we know the expectations from the teachers.”
- “I know that there are many teachers teaching the subject ‘Tomorrow’s Leaders’. It would be fruitful if they could share their teaching methods and experiences with each other.”
- “The teachers could give us more time for in-class discussions. This could provide more chances for us to interact with our team members and develop group cohesion.”

DISCUSSION

Based on the data collected from several focus groups, the present study investigated the views of students taking “Tomorrow’s Leaders,” a credit-bearing course on intrapersonal and interpersonal development at The Hong Kong Polytechnic University. There are several distinct features of this study. First, the present study was one of the few empirical studies documenting the views and perceptions of university students of a credit-bearing course on intrapersonal and interpersonal development. Second, different students from different faculties were recruited so that perspectives of students with different backgrounds were examined. Third, based on the CIPP model [39], content, input, process and product of the course were covered in the focus group interviews.

Based on the themes derived from the focus group discussions, several conclusions could be highlighted from the qualitative findings. First, students from different faculties had positive views and experiences on the subjects, including content of the subjects (e.g., different intrapersonal and interpersonal competences were covered), teaching methods (e.g., group discussion, interactive teaching methods, and various in-class activities were used), teachers (e.g., caring and flexible) and benefits (e.g., better self-understanding after taking the course). The participants underwent a journey of growth throughout the learning experiences in the subject “Tomorrow’s Leaders.” The subject provided them with opportunities to explore themselves in a safe and supportive environment, especially with the lecturers’ provision of “caring” and “flexible” milieu. In addition, the arrangement of sitting in groups in the subject allowed the participants to have better interactions with their fellow classmates, which might be rare in other university subjects. This setting aids the passive students to start building relationships with their classmates through collaboration in the in-class activities and communication in the group discussions during lectures. The participants thus gradually developed the “rapport community” in their own discipline. These could also be shown as students reported positive changes in intrapersonal and interpersonal competences in the interviews. For instances, some students felt that they became more resilient and sensitive in interpersonal contexts after taking the course. Given some real life examples and personal sharing (among group-mates or with lecturers) in lectures, the participants agreed that they could practice how to communicate with group-mates more effectively and appropriately. As one of the participants recalled, “It makes me being even more attentive to my social skills... I will, throughout my entire [life] process, reflect on myself constantly.” Moreover, students regarded this course to be vital and important for university students. Some students claimed that this course could help freshmen adapt to university by developing good inter-personal communication, being more active in learning and enriching the students in holistic

development. These findings are consistent with the results obtained in the pilot stage [14] and with findings based on different evaluation methods [27-37]. Besides the present qualitative findings, other findings based on post-lecture and post-course evaluation as well as qualitative data based on metaphors suggested that students generally had positive views and perceptions on the contents and implementation of the course.

Although most of the students had positive views about the program, some negative comments were reported in the focus groups. First, some students felt that the course was too theoretical and contained too many theories. Although some participants asserted that learning theories or concepts was essential in the university life, it was still difficult for freshmen to grasp the abstract and refined concepts of the theories during their secondary school-university transition. It took time for the students to prepare themselves academically. While this comment was well-acknowledged, it would not be easy to balance the demand for academic excellence (as "Tomorrow's Leaders" is a credit-bearing course) and personal development of the students. One possibility is to give more real life examples to students to make them understand the theories.

Second, some students mentioned that they experienced difficulty in group presentation and assignments. The participants had mentioned that there were "too many" group members in each group. They might have to take time to understand and communicate with each other, though some of the participants found that the groupings in Tomorrow's Leaders helped nurture their social competence ("I also understood the importance of listening to others' ideas"; "This is also a subject about team-building"). In their secondary school-university transition, the students needed time to learn how to present and write their ideas academically. It is understandable for the participants found it difficult to accomplish the term paper and presentation of the subject. To address this issue, workshops on group presentation and term papers were provided. Individual consultations were available upon students' requests. The lecturers tended to be more open to give room for students' originality and let them grow and learn in the process of uncertainty and self-exploration. In fact, most of students performed well in group presentation and assignments and they treasured the opportunity for self-learning.

Finally, a few students complained early class-time. In fact, the earliest class begins at 8:30 am which was more or less the same as the class time in secondary schools. Some of the participants admitted that it was their sleeping habit affecting their perception of "early lecture". To address this issue, various class activities and breaks were offered to refresh students' energy level. Students were also invited to re-think about their lifestyle and sleeping patterns.

Although the positive feedbacks documented can be interpreted as support for the effectiveness of this subject, alternative explanations should be well-acknowledged. First, students might give positive comments on the course because they wished to act as "good students" (i.e., demand characteristics). However, this explanation was not plausible because students were invited to voice out their views honestly and their identities were kept confidential. The other explanation is that only students with positive comments joined in the focus groups. This possibility is low because participants were recruited from different faculties and the researchers did not have prior knowledge about students' perceptions of the course. Third, favorable results might be the results of researchers' biases and preoccupations (i.e., researchers influenced the data collection and analyses processes to "create" this positive picture unconsciously). As the researchers were not directly involved in the data collection

and analyses processes, and there was discussion amongst the authors on the results, this possibility is not high.

Although there is a growing trend in using focus group interviews as the research tool to investigate the in-depth meaning of the “conversational process” of the participants, there is a lack of literature analyzing the limitations of the processes and structures involved [40]. It is thus essential to realize the methodological limitations of focus group interviews in the present study. Firstly, focus groups have been described as particularly useful at an early stage of research as a means for eliciting issues which participants think are relevant [40]. This might help collect large volume of information yet the depth of the data has to be acquired or investigated by administering individual in-depth interviews. To fully reveal the in-depth inferences in dialogues can be very time intensive [41]. Secondly, the moderators of the focus group interviews are the teachers or tutors of “Tomorrow’s Leaders.” Having the moderators from the same background might help facilitate the discussion in putting the participants at their ease [40]. The issues addressed were ensured to be the “same” issues across all the focus groups. However, Hurd and McIntyre [42] reminded the researchers about the “seduction in sameness” between the researchers and the participants that might hinder critical reflexive research. The moderators should be highly aware of the heterogeneity of the discussions in the focus groups and their potential biases in directing the participants to disclose what the moderators desire. Thirdly, during the process of focus group interviews, there might be some confusions of treating the dominant voice as the collective voice of the groups. Smithson [40] asserted that the voice of each focus group interview should be the collective and consensus procedures. The opinions of the participants should not be viewed as static or previously formed. The opinions are constructed in social situations and are the discourses emerged from the context. The researchers thus should be well-aware of the subtleties which are emerged in focus group discussions.

In this chapter we documented the perceived attributes and benefits of a credit-bearing course on leadership and intrapersonal development at The Hong Kong Polytechnic University. The current findings concurred with other studies using various evaluation methods [27-37] that the subject was well-received by the students and the subject was perceived to be beneficial to the development of the students. However, like other studies, the present study has several limitations. First, as the participants were not recruited using random sampling, generalization of the findings should be cautious. Second, due to practical considerations and time constraint, interpretations of results were not counter-checked by participants (i.e., member checking). Third, the inner subjective experiences of students during taking the course were not investigated. Obviously, other qualitative studies, such as in-depth interviews or using students’ daily dairies could be employed in the future studies. Despite these limitations, the present study provided qualitative data to support the positive features of the course “Tomorrow’s Leaders” from students’ perspectives.

ABSTRACT

Qualitative evaluation was conducted for students taking a subject on leadership and intrapersonal development ("Tomorrow's Leaders") at The Hong Kong Polytechnic University. A total of 1,029 students completed a reflection worksheet to describe their experiences about the subject through the use of descriptors and metaphors. Reliability analyses showed that the coding of responses was consistent across raters. Regarding the descriptors used to describe the program, most of the descriptors were positive and around 3% were negative responses. Concerning the metaphors used to represent the program, 93% of the responses were positive in nature, with 12 themes emerging from the responses. Consistent with the findings reported previously, the present chapter suggests that "Tomorrow's Leaders" was well received by the students and they regarded the subject to be beneficial to their own development.

INTRODUCTION

Evaluation serves as an assessment tool for helping program implementers to understand the impact and effectiveness of a program [1]. It allows the implementers to improve the quality of the program by carrying out continuous evaluations throughout the implementation process [2]. Two main approaches, quantitative and qualitative approaches, are often used in conducting evaluation. The quantitative approach relies on numerical data to assess how the participants perceive a program at different time points [3]. Qualitative approach focuses on the evaluation of comprehensive and in-depth thoughts as well as experience of the participants [4]. As qualitative approach can generate data which can capture the experiences of the program participants, a qualitative approach was adopted in this study to evaluate a subject on leadership and intrapersonal development developed for university students in Hong Kong.

In the field of program evaluation, metaphor analysis is one of the major types of qualitative research. It not only serves as a key for people to communicate some abstract thinking and experience [5], it also makes the complex information more structured and clearer [6]. There are several metaphor theories, including salience-imbalance theory [7], domains-interaction theory [8], class-inclusion theory [9] and conceptual metaphor theory [10]. Among these theories, conceptual metaphor theory is the most popular method in educational and psychology research.

Conceptual metaphor theory, also known as cognitive metaphor theory, is often used to understand the abstract concepts and reasoning in our daily life [10]. A conceptual metaphor not only shapes our communication but also influences the way we think and act. According to Lakoff and Johnson [10], “communication is based on the same conceptual system that we use in thinking and acting, language is an important source of evidence for what the system is like” (p. 3). In other words, it is not only a property of language (i.e., a linguistic phenomenon), but also a property of thought (i.e., a cognitive phenomenon) [10, 11].

A conceptual metaphor consists of two domains; they are the target (also named as “topic” or “tenor”) and the source (also referred to as “vehicle”) [10]. The target domain is the conceptual domain that we try to comprehend while the source domain is the conceptual domain from which we use metaphorical expression to understand another conceptual domain. The metaphor can be understood as a mapping from a source domain, that is, sets of conceptual correspondences [10]. For example, “life” (the source) is a “journey” (target). According to Lakoff [12], the life as journey mapping is “a set of ontological correspondences that characterize epistemic correspondence by mapping knowledge about journeys onto knowledge about life” (p. 207). These correspondences allow us to reason about life using the knowledge we use to reason about journeys.

Despite the common use of conceptual metaphor analysis [13-15], little is known whether it can be employed in assessing the extent to which a program achieves the learning outcomes in tertiary education contexts. In particular, it would be helpful to understand how university students perceive a course by using this method. With reference to the Chinese contexts, metaphors have been used in different education contexts. For example, Shek and colleagues used this method to understand students’ perception toward a positive youth development program [4, 16] and two university leadership courses [17-19].

There are several advantages of using metaphors to evaluate the effectiveness of a course. First, more novel ideas and inspirations on how students perceived the course could be obtained by mapping between the metaphors and their learning process [20, 21]. Second, it provides an alternative way to understand the subjects which emphasize holistic personal growth and development. By using conceptual metaphors, students could reflect on their learning and past experience, which in turn yields a more genuine perception with less embellishing thoughts toward the course. Researchers, therefore, can have a better understanding of the reality by providing an “emic, idiographic, case-based position that directs attention to the specifics of particular cases” [22]. Shek and Wu [23] noted that “a thick description would be formulated by revealing the multilayered understanding of students’ learning experience and meaning-making process” (p. 474). This provides a better picture on how the students perceived a course, which especially focused on promoting self-reflection and holistic development of the students.

Given the aforementioned advantages of conceptual metaphors, this study assessed the effectiveness of a university leadership subject “Tomorrow’s Leaders.” Students were asked to write a personal reflection on their experience, perceptions and feelings of the course via the use of conceptual metaphor.

A Subject on Leadership and Intrapersonal Development

“Tomorrow’s Leaders” is a 3-credit subject developed at The Hong Kong Polytechnic University to promote the leadership and intrapersonal competence of the students taking this subject. This course aims at helping students understand the constructs in positive youth development, including cognitive competence, emotional competence, resilience, moral competence, self-understanding, personality, positive and healthy identity, spirituality, social competence, relationship and team building, conflict management, as well as interpersonal communication. Various teaching methods, including lectures, experiential learning activities, group project presentation and individual written assignments, are used in this course to nurture both the interpersonal and intrapersonal competencies of the students.

There are several objectives of this course: a) to enable students to learn and integrate theories, research and concepts of effective leadership qualities (particularly intrapersonal and interpersonal qualities) of effective leaders; b) to develop students’ intrapersonal and interpersonal qualities of effective leaders; and c) to increase students’ awareness of the importance of lifelong learning.

OUR STUDY

A total of 1,029 students enrolled in the subject “Tomorrow’s Leaders” in the second semester of the 2012/2013 academic year. By using a reflection worksheet, students were asked to choose three phrases or words to describe their feelings toward the course. Also, they were invited to write a metaphor which best described the course and to give explanations about the metaphor. A total of 885 worksheets were collected at the end of the course.

Students were informed that their participation was voluntary and the data were used for educational and research purposes.

For each descriptor, four types of codes (i.e., positive codes, negative codes, neutral codes and undecided codes) were adopted. Moreover, to analyze the metaphors, thematic analysis was performed as Miles and Huberman [24] contended that this method is “a way of grouping those summaries into a small number of sets, themes or constructs... it’s an analogue to the cluster-analytic and factor-analytic devices used in statistical analysis” (p. 69).

To enhance the coding reliability, intra-rater and inter-rater reliability tests were carried out. Twenty raw descriptors and twenty metaphors were randomly selected for the intra- and inter-rater reliability tests. Two researchers, who did not participate in the coding analysis, were recruited to perform the inter-rater reliability test. One of them has a master’s degree in Educational Psychology and another has a bachelor’s degree in Social Sciences and is currently studying a master’s degree. All researchers completed the task independently without discussion.

FINDINGS

A total of 2,642 descriptors were received and categorized into 25 areas. In Table 1, there were 2,548 (96.4%) positive descriptors and 74 (2.8%) negative descriptors. In Table 2, negative descriptors were found, such as “difficult,” “boring,” “time-consuming,” “tiring,” “noisy,” “not environmentally friendly” and “not helpful.” Lastly, there were 8 (0.3%) neutral and 12 (0.5%) undecided descriptors.

Table 1. Categorization of descriptors used by the participants to describe the course

For the metaphors, a total of 874 raw data, which involved 1,694 codes, were obtained (Table 3). Results showed that 813 were positive metaphors (93.0%), such as “*journey*,” “*guide*,” “*light*,” “*book*,” “*buffet*,” “*tree*” and “*mirror*.” Moreover, 48 metaphors (5.5%) were regarded as neutral. Some neutral metaphors were “*games*,” “*rope*” and “*paper*.” Based on the 874 metaphors, 12 themes were categorized, including “entertainment/relaxing,” “functional,” “gift,” “guidance,” “hope,” “interactive,” “knowledge,” “meaningful,” “multi-dimension,” “necessity,” “reflection” and “others.” The results of intra- and inter-rater reliability tests are good (intra-rater reliability tests: 85%, 90% and 100%; inter-rater reliability tests: 82%, 85% and 85%).

DISCUSSION

The purpose of the present study was to assess the students’ perception of a leadership course “Tomorrow’s Leaders” by using a qualitative approach. There are several strengths of this paper. First, by using descriptors and metaphors, students can use their own words to conceptualize their learning experiences and impact of the course. Second, a large sample size, which is rare in the field of qualitative evaluation research, was obtained. Third, the results of inter-rater and intra-rater reliability tests were good.

In general, students perceived the course positively. First, based on the results of the descriptors, about 96% of the students perceived the course was helpful, meaningful, reflective, interesting and relaxing. In fact, one of the characteristics of the subject “Tomorrow’s Leaders” is to provide an opportunity to students to participate in a variety of in-class activities and the reflective exercises related to the concepts and theories of leadership qualities (e.g., cognitive competence, emotional competence, resilience, moral competence, self-understanding, personality, positive and healthy identity, spirituality, social competence, relationship and team building, conflict management and interpersonal communication). With the adoption of experiential learning approach, students were asked to participate in different interactive activities and found these activities interesting and inspiring as reflected from the positive descriptors. Through the diversified learning experience, students were more aware of their intra- and interpersonal competencies. This explains why the students used the positive descriptors, such as *helpful*, *meaningful* and *reflective*, to describe the course.

Second, based on the results of metaphor analyses, the majority of the students (above 90%) perceived the course positively as reflected by the metaphors, such as *a meaningful tour*, *nutrients*, *guide*, *light*, *book*, *buffet*, *rainbow*, *treasure*, *tree* and *mirror*. In addition, the present study extends prior studies [18, 25, 26] by grouping the metaphors into themes. In this study, all metaphors were categorized into twelve themes, which demonstrated the extent to which the intended learning outcomes of the course were achieved from the students’ perspective.

Some metaphors were coded under the themes, such as “*entertaining*,” “*relaxing*” and “*gift*,” indicating that the students enjoyed the course and would take a similar course in the future. Some were categorized into “*functional*,” “*knowledge*,” “*multi-dimension*” and “*necessity*,” showing that students understood different qualities of effective leaders and recognized the importance of these attributes. Other themes, such as “*hope*” and “*guidance*,”

demonstrated that students were inspired by the course content and perceived positively toward the future. The findings of the present study showed that the intended learning outcomes of the course have been achieved from the students' perspective.

While the findings based on descriptors and metaphors are generally positive, there are plausible alternative explanations for the findings. First, it can be argued that the students might please the teachers by giving positive responses (i.e., demand characteristics). However, this possibility is not high because the students were encouraged to give their honest responses and negative responses. Second, the students gave positive responses because they were afraid to be punished. This possibility is also not high because the students were not required to write down their names on the reflection sheets.

Several limitations of the study should be taken into account. First, the data were collected at one single point of time (i.e., at the end of the semester). This cross-sectional design may limit the understanding of the long-term effects of the course on students' personal growth and development. Second, the students were asked to complete a worksheet. Some students, especially those who were not good at writing, may not be able to express their innermost feelings and thoughts freely by using this paper-and-pencil format. In particular, the students may prefer to have a quiet place with no limit on the time frame to reflect on their learning experience. This may be difficult as the students were asked to submit the worksheets at a particular amount of time (i.e., 5-10 minutes). This might hinder the students to do an in-depth reflection during the class. Finally, the worksheet format also limits the depth of information that can be gathered.

In order to have a more comprehensive understanding of students' perception and thoughts about this course, future studies may consider the use of mixed-method approach. By using both quantitative and qualitative methods, a more comprehensive picture of the effectiveness of the course can be obtained. Also, other qualitative methods like focus-group interviews and weekly diaries could be used in the future. Therefore, students can express the innermost feelings comfortably and freely without hesitation. This can help researchers capture a better picture of the impact and effectiveness of a holistic youth development university course. Despite the above limitations, students generally perceived the subject positively and beneficial to their academic and personal lives. It is important as university students is a sizable part of population and will be leaders in different fields and disciplines. The current study sheds light on promoting holistic development of students in the university context.

before 2012/13 academic year, which was modeled after the British system, but with the introduction of the higher education reform, university structure was changed to four years, with the additional year devoted to general education. At The Hong Kong Polytechnic University (PolyU), the General University Requirements (GUR) were designed to promote the holistic development of the students. In this book we summarize the evaluation findings and answer the question of how well the desired graduate attributes were achieved. It is our modest wish that through this book, we will have a better understanding of the implementation of the general education program in Hong Kong.

INTRODUCTION

What are the attributes of a “good” university? With respect to this question, many people would say that a good university should have a good ranking based on international ranking systems such as the QS World University Rankings, the Times Higher Education World University Rankings, and Center for World University Rankings. Unfortunately, while ranking figures may give some snapshots about universities based on quantitative figures, they do not give any idea about the quality of education received by the students, particularly with respect to the question of how the undergraduate program promotes the holistic development of students. In fact, in most ranking schemes, we do not look at what subjects are offered and the impact of the undergraduate program on students. Most important of all, many ranking systems simply do not answer the question of how the undergraduate curriculum may meet the diverse needs of university students.

Actually, contemporary universities have been criticized for failing to achieve the ultimate aim of education (i.e., helping students to develop in a holistic manner). Harry Lewis [1] provocatively commented that “universities have forgotten their larger educational role for college students, namely to succeed, better than ever, as creators and repositories of knowledge. But they have forgotten the fundamental job any undergraduate education is to turn eighteen- and nineteen-year-olds into twenty-one- and twenty-two-year-olds, to help them grow up, to learn who they are, to search for a large purpose of their lives, and to leave the college as better human beings [1, p.xii].” He also remarked that “over the decades I have heard many academic discussions about teaching, about the curriculum, about grading, about athletics, and about responding to student misdeeds. I have almost never heard discussions among professors about making students better people” [1]. Obviously, the comments of Lewis motivate us to think about what should be the essence of undergraduate curriculum.

From a youth developmental perspective, we have to seriously re-consider the needs of university students and ask how the undergraduate curriculum can meet their needs. A few centuries ago, university education was fundamentally “scholarly” in nature, nurturing students in the “ivory tower.” In the past decades, university education became more vocationally oriented, which addressed the needs of occupational needs of the students. However, with the growing complexities of the society and emergence of the knowledge-based economy, we have to ask what sort of development university students should have. There is a growing voice arguing that besides “hard skills” in the disciplinary training, students should also acquire “soft skills” to respond to the needs of the changing world. There are two main areas of “soft skills” that university students should acquire. The first is on

intrapersonal development. Some of the qualities include psychosocial competence (cognitive, emotional, social and moral competence), communication skills, resilience, positive identity, spirituality. Obviously, qualities such as resilience and emotional intelligence are very important for young people in the knowledge-based economy. On the other hand, university students should have good interpersonal skills, including relationship building, relationship maintenance, team building and conflict resolution. Most important of all, moral character is an important desired graduate attribute under the service economy. For example, having excellent skills in finance is good, but if such skills are used to issue junk bonds, it would not be desirable. Essentially, graduates should do the “right” things in a world full of moral confusion. Besides, addressing the “soft skills” of university students is also important because there are growing developmental issues (e.g., depression, suicidal and alcoholism) in university students.

With specific reference to Hong Kong, the university structure was a three-year program before 2012/13 academic year, which was modeled after the British system. With the introduction of higher education reform, university structure was changed to four years, with the additional year devoted to general education. At The Hong Kong Polytechnic University (PolyU), the General University Requirements (GUR) were designed to promote the holistic development of the students. There are several components of the GUR, including a) Language and communication requirements (9 credits); b) Freshmen seminar (3 credits); c) Cluster areas requirements (12 credits); d) Leadership and intrapersonal development (3 credits); e) Service-learning (3 credits); and f) Healthy lifestyle (non-credit bearing). Through the new 4-year undergraduate curriculum, it is expected that the graduate would develop holistically, with the attributes of critical thinking, innovative problem solving, effective communication, ethical leadership and lifelong learning.

Obviously, having a set of desired graduate attributes and an elegant 4-year new undergraduate program are not enough. We have to conduct evaluation studies to examine the impact of the new 4-year curriculum. To understand the effectiveness of the 4-year new undergraduate program, we started collecting evaluation data starting from the 2012/13 academic year. There are several components in the evaluation study. First, we conducted objective outcome evaluation with three sub-studies: a) we tracked a random sample of students over four years; b) we compared the third-year students of the PolyU 4-year program with the third-year students of the PolyU 3-year program, and c) we compared the third-year students of PolyU 4-year program with the third-year students in a comparable university in Hong Kong. Second, we conducted qualitative studies including focus group studies involving students and teachers. A longitudinal case study was also carried out. Third, we conducted secondary data analyses looking at the student feedbacks through student feedback questionnaires. Fourth, changes in the students were examined using the repertory grid test.

We have already published papers on the effectiveness of the 4-year program [2-5]. In this book, we have included papers published in the *International Journal of Adolescent Medicine and Health* in 2017 (volume 29, number 1) and *International Journal of Child and Adolescent Health* to be published in 2019 (volume 12, number 1). It is our modest wish that through these papers, we will have a better understanding of the implementation of the general education program in Hong Kong.

ABSTRACT

In many adolescent developmental models, serving others is regarded as an important attribute of healthy development of adolescents and young adults. Besides, programs promoting university students' service to the community, such as service learning subjects/programs, are developed. In this paper, it is argued that to facilitate community service competence of university students, there is a need to cultivate their basic leadership competencies, including intrapersonal and interpersonal competencies. At The Hong Kong Polytechnic University, a 3-credit subject entitled "Tomorrow's leaders" was developed to promote leadership competencies in students. In the past five years, different evaluation strategies have been used to examine the impact of the subject. Evaluation findings consistently showed that this subject was able to promote psychosocial competencies and ethical leadership qualities after students took this subject, which forms a solid foundation for students to undertake their service learning projects.

INTRODUCTION

Serving others is an important vehicle through which healthy development of adolescents and young adults can be promoted. For example, Benson [1] proposed 40 adolescent developmental assets. Amongst these assets, caring (i.e., a young person places a strong emphasis on helping other people) is an important developmental asset conducive to healthy adolescent development. In the positive youth development literature, serving others is intimately related to six “C”s of optimal youth development - competence, character, confidence, connectedness, caring, compassion, and contribution [2].

With particular reference to Hong Kong, involvement of young people in community service has undergone much transformation throughout the history of Hong Kong. Hong Kong was a British colony before 1997. The mission of university education in Colonial Hong Kong was to nurture elites for Hong Kong and Britain who were submissive to the British. As such, students were not encouraged to have much community participation. To set a clear and non-political goal for young people that could consume their energy, the education system was very examination-oriented. Although Hong Kong has become part of China since July 1997, the education system is still very examination-oriented where young people are encouraged to strive for academic excellence. While there is greater emphasis on voluntary service in high school students in the recent education reform, the motive of the students in community engagement is still quite instrumental, such as using voluntary activities to “enrich” their curriculum vitae.

Service Learning in the University Context: Promise and Challenge

For university students in Hong Kong, opportunities for community service have increased in the past decade, although the service learning movement is still in its infancy. There are two key questions we should ask. The first question is whether academic work on service learning is adequately covered in the scientific literature. The second question is whether university students are adequately prepared for service learning. Regarding the former question, computer search shows that there is not much academic work on service learning in Hong Kong. From the statistics, it can be concluded that scientific literature on service learning is still very inadequate. While Chinese young people constitutes roughly one-fifth of the world’s youth population, less than 1% of the published work is based on Chinese people.

To promote service learning in undergraduate students, every undergraduate student at The Hong Kong Polytechnic University (PolyU) has to fulfill the Service Learning Requirement by taking a 3-credit Service Learning course since the 2012/13 academic year. This initiative is a pioneer in two aspects. First, PolyU is the first university in Hong Kong (and probably in China) that includes Service Learning Requirement as a graduation requirement. Second, to give due recognition to students and teachers, three credits are given to the Service Learning Requirement. This ensures that there would be a universal coverage for all the undergraduate students. Besides the pilot projects developed before the 2012/13 academic year, a 10-hour e-learning package for the students [3] and a 3-hour e-learning package for the teachers [4] have been developed.

However, while we endorse the service learning initiative at PolyU, we have to ask a more fundamental question - are undergraduate students ready and well-equipped to serve other people? This question should be asked because there is research evidence suggesting that there are developmental issues in contemporary university students [5], such as growing mental health problems, decline in empathy, and growing egocentrism in university students. Shek and Cheung [6] further reported developmental problems in university students, such as lifestyle and Internet addiction problems. As pointed out by Bips [7], "students now are less mature and often not ready for the responsibility of being in college ...many students today lack the resilience and are unable to summon strategies to cope ...many students are often not prepared to be young 'adults' with all the responsibilities of life" (p. 1).

Because of the above observations, it would be an ideal strategy to equip students with competence before they take up challenges in service learning. In the literature of positive youth development, it is asserted that it is important to nurture the psychosocial competence of young people [8, 9]. For instance, Weissberg and O'Brien [10] suggested that social-emotional competencies such as self-awareness, social awareness, and responsible actions are basic to youth development. Besides, character development is regarded as an ideal developmental goal [2].

Park, Peterson and Seligman [11] pointed out that there are 24 character strengths, which can be subsumed under six broad categories of virtue, including wisdom and knowledge (such as love of learning), courage (such as honesty), humanity (such as love and social intelligence), justice (such as fairness), temperance (such as forgiveness and modesty), and transcendence (such as gratitude and hope). Interestingly, although character education is covered in primary and high schools, focus on morality is less emphasized in higher education. Probably it is assumed that university students should have attained moral maturity.

Crosby [12] asked an interesting and important question –what is the most important subject in the university? Crosby [12] argued that "some would say that it is a course in economics or business, since that is what most jobs, at bottom, seem to be about. Others might want to argue that it is a course in mathematics or computer science, since so many of the jobs in our world are becoming scientific and technological. Still others might claim that it is a course in English composition, critical thinking, or speech, since clear and effective communication is so essential in any job. But the most important course at the university is none of the above. It is 'the course of each student's own life' "(p. 1). In fact, Crosby [12] argued that character development is of paramount importance and that "proper development of a student's character can enable that student to see beyond education merely as certification and preparation for a job to the critical importance and value of a life that is lived well in all of its dimensions, a life that continues throughout its course to develop and sustain a sense of purpose and fulfillment in oneself and the satisfaction of contributing responsibly and effectively to the wellbeing of others" (p. 1). Hence, while we promote service learning in undergraduate students, it is equally important to nurture their character and psychosocial competencies [13].

Promotion of Leadership Competencies in University Students

Starting from the 2012/13 academic year, the undergraduate curriculum in universities in Hong Kong has changed from three years to four years. At The Hong Kong Polytechnic University, undergraduate students are required to complete a requirement on leadership and intrapersonal development. As such, a subject entitled “Tomorrow’s leaders” was developed to help the students fulfill this requirement with the following content, which is intended to nurture their psychosocial competencies and character:

- Role of self-understanding and interpersonal relationship qualities in effective leadership
- Self-understanding: personality characteristics leading to effective leadership
- Emotional competence: understanding the emotions of oneself and others; role of EQ in effective leadership
- Cognitive competence: different components of cognitive competence, such as IQ; creative, logical and critical thinking, cognitive competence in effective leadership
- Resilience: life adversities and challenges; coping with life stresses; role of resilience quotient (AQ) in effective leadership
- Spirituality: meaning in life; spirituality and well-being; role of spiritual quotient (SQ) in effective leadership; servant leadership
- Ethics and morality: moral competence; ethical issues and leadership; morality in effective leadership
- Social competence: skills basic to social interaction; positive human relationship; social skills in effective leadership; egocentrism in university students
- Clear and positive identity: role of self-identity in human development; self-evaluation and self-worth; self-discrepancies; role of positive self-concept in leadership effectiveness
- Interpersonal communication: concepts and skills; effective interpersonal communication; communication skills and effective leadership
- Interpersonal conflict; dealing with conflict; conflict resolution and leadership; team building; relationship quality and effective leadership
- Personal integrity and sense of responsibility in effective leaders; egocentrism in university students
- Self-leadership: leading one’s own life; self-leadership initiatives

There are two stages on the development and implementation of this subject. In the pilot stage, a 2-credit course was offered to 268 and 195 students in the 2010/11 and 2011/12 school years, respectively [14]. Since the 2012/13 academic year, the subject has been implemented on a full implementation basis (i.e., full implementation stage). In the 2012/13 to the 2015/16 school year, the course was offered to 2,000+ students per year.

EVALUATION OF THE SUBJECT

To understand the impact of the subject, different evaluation methods were used [14]. These include objective outcome evaluation, post-lecture subjective outcome evaluation, subjective outcome evaluation (post-lecture and post-course student satisfaction survey), process evaluation, and qualitative evaluation based on written narratives and focus groups were carried out. These methods and the related findings are presented in the following sections.

Objective Outcome Evaluation

Objective outcome evaluation typically examines changes in program participants after they join a program such as a credit-bearing course. To examine changes in students after taking “Tomorrow’s leaders”, two main research designs have been used. First, a one- group pretest-posttest design has been used to evaluate changes in several cohorts of students. Second, a non-equivalent control group design was used. For the outcome measures, 13 measures based on the Chinese Positive Youth Development Scale were used, including indicators in the domains of resilience, psychosocial competence (social, emotional, cognitive, behavioral and moral), self-determination, self-efficacy, positive identity, belief in the future, spirituality, prosocial norms and prosocial involvement. Several composite measures based on the indicators in the subscales were also used.

The findings based on the one group pretest-posttest design are generally positive. In the pilot stage, evaluation findings showed that the participants displayed positive changes in some of the domains (e.g., emotional competence and positive identity) and composite measures [15]. In the full implementation stage, based on the responses of 1,029 students, Shek and Ma [16] showed that although students showed positive changes in self-determination, thriving, and life satisfaction, their scores on some of the domains declined over time. Further analyses suggest that the impact of the course might differ for students in different programs.

Besides the one-group pretest-posttest design, a quasi-experimental study was conducted in the pilot stage with an experimental group ($n=195$) and a control group ($n=71$), with similar socio-demographic characteristics in the two groups. After controlling the pretest scores, analyses showed that the students in the experimental group showed a higher level of psychosocial competence indexed by resilience, emotional competence, and beliefs in the future. The study suggests that this course is able to promote psychosocial competence and ethical leadership in Chinese university students in Hong Kong [17].

Subjective Outcome Evaluation (Post-Lecture Evaluation)

To provide feedback to teachers, a post-lecture questionnaire was used after each lecture in the pilot stage. Based on the data collected by 2,039 post-lecture subjective outcome evaluation forms, Shek [18] showed that the students perceived the subject, class, and teacher attributes in a favorable light, with 93% and 90% of the respondents having positive views of

the teachers and subject, respectively. In another study in the pilot stage, Shek and Sun [19] showed that the client satisfaction findings on the subject, class, and teacher attributes were very positive, with over nine-tenths of the respondents showing positive evaluation of the subject and the teacher. In short, post-lecture evaluation findings suggest that the lectures were well-received by the students.

In the full implementation stage, Shek and Leung [20] conducted post-lecture evaluation assessing student perception of the subject, instructor and effectiveness among 1,029 students. The findings generally revealed that the students had a very positive evaluation of the lectures. As predicted, the findings supported a three-factor structure, and global evaluation of the lectures and the teacher was predicted by the perceived subject, lecture and teacher attributes. In another study based on 1,070 students, Yu, Shek and Leung [21] carried out a post-lecture evaluation of the modified version of the course. The results showed that the students generally held positive views about the lectures and teachers. The findings also supported the hypothesis that the perceived subject, teacher and lecture attributes predicted overall evaluation of the teachers and the lectures.

Subjective Outcome Evaluation (Post-Subject Evaluation)

Besides the post-lecture evaluation, a post-course subjective evaluation using a validated client satisfaction scale (comprising perceived program quality, perceived implementers quality, and perceived program effectiveness) was conducted to examine the views of the students after taking the course. Based on the responses of 189 students, Shek and Sun [22] reported that over 90% of the students had positive views of the subject and the course was effective in helping the students to thrive. Shek and Sun [23] similarly showed that the client satisfaction findings were very positive from 195 students measured by the same subjective outcome evaluation scale, with high proportion of students agreeing that the subject had helped them develop in a holistic manner. In the full implementation stage, post-course subjective outcome evaluation studies were also conducted. Researchers showed that the students had a positive evaluation of the subject, the instructor as well as the perceived benefits of the subject [24, 25].

Process Evaluation

A process evaluation was conducted to understand the implementation quality of the course in the pilot stage. In the first process evaluation study, Shek and Sun [26] showed that the mean program adherence across the lectures (i.e., 85.71%) and the implementation quality (such as reflection opportunity and preparation quality) were high. In the second piloting exercise, Shek and Sun [27] showed that the mean program adherence and the quality of implementation were generally high. In both studies, qualities of the program implementation were predictive of the overall quality and the success of the program.

Qualitative Evaluation (Individual Reflection)

Several qualitative evaluation strategies involving individual reflection have been used to evaluate the impact of the subject. In the first strategy, we asked students to use descriptors and metaphors to portray their experiences. In the pilot stage, Shek and Sun [28] reported that students generally used positive descriptors (e.g., “meaningful” and “enlightening”) and positive metaphors (such as “meaningful tours” and “compass”) to describe the subject. In the full implementation stage, Shek and Law [29] also showed that the students ($N = 143$) gave positive responses, with 94.4% and 92.7% of positive responses for descriptors and metaphors, respectively.

The second evaluation strategy was to invite the students to write personal reflections on the course. Shek [30] reported some personal reflections as follows:

“This course, Tomorrow’s Leaders, was very different from what I have taken in my major, Marketing. In my major, there are only lectures and tutorials. After the lecturers finished what they wanted to say, they left. Interactions were seldom seen. But in Tomorrow’s Leaders, there were many interactions which shocked me at the very beginning. Nearly everyone has to share what he/she thinks and feels during the lesson. ...This is something I can never encounter if I haven’t taken this course. Also, the most interesting part was the worksheet. First, I think the worksheet is just like work in primary school. A bit wired. But later I find that these few pieces of paper can help me find my truth and know more about myself. I have the deepest feeling when I was filling the worksheet about my strengths, weaknesses and ideal-self. I thought a lot. I would like to find out the answers. Fortunately, I found it, more than the worksheet required.”

“It is a valuable experience to study this subject. In the course of this subject, different activities, writings, and drawings enhanced my understanding about myself, including my strengths and weaknesses, which helped me improve my interpersonal skills. The topics taught in this subject are important to our daily living. For instance, we need emotional competence when our feeling is fluctuating; we need resilience when we are in a deadlock. Good interpersonal skill is a must for all of us nowadays when almost every one of us is holding a bachelor degree. Our personality and how we deal with problems are more important than what we know.”

Finally, to motivate the students, students with outstanding performance were awarded the Wofoo Foundation Scholarship and they were invited to write personal reflections on the subject. The scholarship recipients generally felt that there was a strong need to have this subject and shared that there were many benefits of the subject. Besides, they saw that there were many attractive features in the subject and the lectures were interesting and interactive. These attributes can be seen in the reflection of one scholarship recipient report by Shek and Wu [31] as follows:

“The subject facilitates me to be more confident in taking up a leader’s role in my social work profession. The course introduced 13 elements that a successful leader should possess. I have heard some of them before but some of them were new to me. One new element has inspired me a lot and provided me insight to be a leader is “spirituality.” A spiritual leadership style should include spiritual values such as integrity, honesty, and humility. By showing us a movie called “Invictus,” the teacher used Nelson Mandela as an example to demonstrate these elements. During the movie, I was impressed by the decision made by Mandela. He provided meaning (i.e., unity of one nation) for every political decision even though such decision would be at the expense of his political capital. He could create ethical influence and climate that would influence the others. His belief in unity and caring for his original enemies guided him to be the President. This element inspired me that as a social worker, despite facing difficulties and structural constraints, there are some human values that I have to uphold – that is honest communication with self and others and at the same time be respectful and caring to every human, even the one you hate or originally is your enemy. Of course, this type of leadership quality sounds hard to achieve. It is difficult to love the one you hate. However, such leadership practice is attractive to me and I think I am willing to learn to be a spiritual leader in order to make ethical influence to my followers.”

Similar positive reflections can be seen in the reflections of the scholarship holders reported by Shek, Wu and Law [32]:

“Concerning how this subject assisted my personal development, it changed my belief in leadership. I used to think that leadership is innate. The idea had been consolidated during my secondary school life when only the best students were nominated to join leadership camps and workshops. Such students had been academically outstanding in primary school. Later, they became the president of the student union or held other important student posts in school. Nevertheless, the subject provided an alternative perspective for me. The materials suggest that leadership attributes can be developed. Everyone can be a leader. It gives me a new hope.”

Qualitative Evaluation (Focus Group Interviews)

In the pilot stage, Shek and Sun [33] reported findings of a study using focus groups to examine the views of the students on the course. Generally speaking, the students were positive about the interesting course content, the interactive class atmosphere, and the useful guidance of the teachers. Most important of all, the students felt that the subject could promote their reflection and self-understanding. Some of the benefits of the subject were as follows:

- “I have changed to another person with at least some changes – I will think more about different possibilities of a matter so that it may change from unsuccessful to successful outcomes. This would promote my competitiveness.”
- “One of the changes I have after taking this subject is that I have my own views. That is, I have more courage to say ‘yes’ or ‘no’.”
- “I think this subject is not primarily concerned about IQ but EQ. Actually, EQ is very important in our study and after our graduation. There are many opportunities where we have to use our EQ. I feel that it is very useful. After we heard the lectures, we realized that we neglected something important and we pay attention to them again.”
- “I felt that after taking this course, I realized something which I had neglected before such as understanding myself.”
- “I had more understanding about my identity. After reading journal papers and doing my assignment, I understand that there are different ways of attaining ideal positive identity. When I do things now, I will think more and think about other people.”
- “I feel that it is helpful to my self-confidence. When you know your strengths and weaknesses, you know how to appreciate yourself.”
- “We learned how to do a group project. If you are a leader, you have to deal with some emergencies and how to relate to the professor. These would be helpful to our academic performance.”

In the focus group study, the students also highlighted the need for this subject:

- “I absolutely agree that we need this course. Maybe you have grown up in a very protective family and you will offend other people ...We have to learn how to evaluate oneself and then change some of the ‘bad things’ and reintegrate in the

society. I think this understanding is not just unique to university students. It is vital to everybody.”

- “When I communicate with secondary school students, I find that they have difficulty to express themselves and manage their matters. Therefore, having this course to help them reflect is a good method.”
- “This is a very good subject which is helpful for future. University education relies heavily on self-autonomy and interpersonal relationships.”

5-Year Longitudinal Study

“Tomorrow’s Leaders” was developed to enable students to satisfy the Leadership and Intrapersonal Development requirement of the General University Requirements (GUR) under the new 4-year undergraduate program. To understand students’ experiences of the GUR, a 5-year longitudinal study has been conducted [34]. We have conducted focus groups as well as secondary data analyses of the data collected by the Student Feedback Questionnaire to understand student feedback on “Tomorrow’s Leaders”. For example, based on the secondary data analyses of the data collected via the Student Feedback Questionnaire, the results showed that the students were satisfied with the subject and teaching of the instructor [35].

DISCUSSION

In this chapter, we outlined the development of a subject entitled “Tomorrow’s Leaders” for students to fulfill the Leadership and Intrapersonal Development requirement in the 4-year undergraduate program at The Hong Kong Polytechnic University (PolyU). The subject was piloted in the 2010-2012 academic years and it has been fully implemented since the 2012/13 academic year. Through several evaluation mechanisms, we have examined the impact of the subject on the psychosocial competencies and ethical leadership of the students. Overall speaking, the evaluation findings are overwhelmingly positive [14]. The findings are promising because we have used multiple evaluation methods to collect multiple types of data from multiple stakeholders.

According to Shek and Wong [36], adolescent developmental issues would not “disappear overnight”. With reference to this warning, there is a need to strengthen the psychosocial competencies and character strengths of students before they undertake any Service Learning projects. Interestingly, although there are numerous positive youth development programs designed for high school students [37], there are comparatively fewer programs developed for university students. In the present context, the evaluation findings demonstrate the usefulness of designing credit-bearing subjects using principles of the positive youth development approach. In fact, the evaluation findings accumulated in the past six years clearly point out that promotion of psychosocial competence in university students via credit bearing subjects is a promising approach to promote holistic development of university students.

Actually, the evaluation findings related to “Tomorrow’s Leaders” strongly complement the evaluation findings based on a project entitled “P.A.T.H.S. to Adulthood: A Jockey Club Youth Enhancement Scheme” (Project P.A.T.H.S.), which was designed to promote holistic development in junior secondary school students. The Project P.A.T.H.S. was launched more than one decade ago, serving more than 280,000 secondary school students (600,000+ man-times) involving more than 280 secondary schools in Hong Kong with an earmarked grant of HK\$750 million. Multiple evaluation findings showed that the program was effective in promoting holistic development and reducing risk behaviors in young people in Hong Kong [38]. Taken as a whole, the evaluation findings collected from the high school and tertiary education settings suggested that it is possible to promote psychosocial competence and character development in young people using the curriculum-based approach.

Palmer [39] maintained that it is important to help students understand themselves. As he argued, “our colleges and universities help student examine many dimensions of the external world - history, politics, economics, physical reality; yet we rarely turn the lens inward to help students examine their own lives. This lack of critical inquiry into these personal dimensions of students’ lives reflects a multi-leveled fear on the part of academics – the fear of venturing into ‘subjective territory’, saying, ‘I don’t want to go there because I’m not a psychotherapist’. But faculty and staff need to find ways of inviting students to examine these inner drivers and dynamics within the classroom and co-curricular activities that lead to greater self-understanding, without which one cannot be said to be well-educated” (p. 4). Obviously, “Tomorrow’s Leaders” is a constructive response to this comment.

Astin [40] also pointed out that “although we argued that institutions needed to focus more on student outcomes, we avoided specifying what any of these outcomes should be, arguing instead that this task should be left largely to the individual institution. In retrospect, I think this was a mistake. If we had been more forthcoming about our own values with respect to some of the most important student outcomes, we certainly would have generated more controversy, but I think the controversy would have been healthy. More specifically, I wish we had spoken more directly about the importance of so-called affective outcomes such as self-understanding, tolerance, honesty, citizenship, and social responsibility” (p. 587). Obviously, “Tomorrow’s Leaders” can strengthen the affective outcomes of student development which provides a solid foundation for service learning activities. We earnestly hope that the subject can provide the necessary foundation through which the Service Learning projects can be competently executed by the university students in Hong Kong.

ACKNOWLEDGMENTS

This work is financially supported by the Global Youth Leadership Institute at The Hong Kong Polytechnic University. The author thanks The Hong Kong Polytechnic University for its financial support (via the Teaching Development Grant and funding for 3-3-4 new curriculum) in the development of “Tomorrow’s Leaders” and the pilot evaluation studies. The evaluation studies conducted after 2011/12 academic year were supported by the Department of Applied Social Sciences, The Hong Kong Polytechnic University. The author also thanks Wofoo Foundation for providing scholarships for the outstanding students taking

this subject. This chapter is based on a paper to be published in the *International Journal of Child and Adolescent Health*.

ABSTRACT

Many universities have integrated community engagement in their undergraduate programs. At The Hong Kong Polytechnic University, it is compulsory for all students to take at least one 3-credit subject on service-learning (SL). In each SL subject, there are purpose-designed academic teaching, rigorous service and structured assessment components. At full implementation, roughly 4,500 undergraduate students would enroll in around 70 subjects offered by a wide range of departments and faculties across the university. The subjects cover a diverse range of topics, such as digital divide, learning difficulties, engineering design, healthy living environments, orthotics, and eco-tourism. The target beneficiaries are equally diverse, including slum dwellers, disabled people,

children with HIV, villagers without water nor electricity, new immigrants, mentally ill patients, ethnic minorities, and children of migrant workers. To date, students have served different groups of clients in Hong Kong, Chinese Mainland, Cambodia, Vietnam, Indonesia, Myanmar, and Rwanda. This chapter outlines the pedagogical design of the program, challenges and strategies for implementation, and the experiences gained so far.

INTRODUCTION

In 2012, the undergraduate degree education structure in Hong Kong moved from three years to four years. One of the intended outcomes of the change is to ensure that “the higher education institutions will be in a better position to provide a balanced education to their students, through an integrated 4-year undergraduate programme, that allows for a broader knowledge base to support specialised learning” [1]. Internationally, increasing emphasis has been put on the role of universities in educating students into socially responsible citizens with a heart to serve the community [2-5].

At The Hong Kong Polytechnic University (PolyU), one of the strategic goals is to nurture all-round graduates with social and national responsibility. To this end, PolyU has successfully encouraged many students to engage with society through community service, mostly in the form of non-credit-bearing, co-curricular activities both local and offshore even before the inception of the four-year curriculum [6]. With the development of the 4-year undergraduate degree structure, all students are required to complete a 3-credit subject with an approved SL component in order to qualify for graduation. Given the size of the student body, this is a mammoth task with several major challenges. First, there is a need to design a rigorous academic structure for the development, offering, and quality control of SL subjects. Second, it is necessary to cultivate long-term service projects and collaborative relationships with external collaborators such as non-government organizations. Third, we have to build a critical mass of academic staff with the passion and expertise to offer SL subjects. Finally, there is a need to develop robust mechanisms for funding SL subjects and associated projects.

This chapter examines the major challenges and the institutional strategies in meeting the above challenges. In the development of the institutional strategy for SL, we have carefully studied and reviewed experiences at many institutions, including the University of San Francisco, University of Pennsylvania, Tufts University, Purdue University, among others, as well as the consolidated information at Campus Compact. Consequently, we have adopted many of their good practices.

ACADEMIC STRUCTURE

As an important type of experiential learning, SL integrates community service with instruction and reflection to enrich students’ learning experience in order to achieve intended institutional or program learning outcomes. It enhances students’ sense of civic responsibility and engagement as well as benefits the community at large on the other [7].

Background of Service-Learning at PolyU

Prior to the curriculum changes in 2012, approximately 1,000 students and staffs at PolyU had engaged in various voluntary community service projects each year. Many such projects were organized under the Community Service Learning Program (CSLP) managed by the Student Affairs Office. One exemplary project was the Assistive Technology Development Initiative where a team of students from the Electronic and Information Engineering Department designed and developed a range of assistive devices to help handicapped students in a special school to use computers, including enlarged buttons for students with difficulties in making precise motions with their hands and fingers. In another project, a team of students from different health care departments in the Faculty of Health and Social Sciences jointly organized with the Xinyang Vocational Technical College an integrated health promotion activity in rural Henan province in central China. It provided environmental, health and nutritional assessment for more than 100 primary school students.

Each year CSLP gave awards to exemplary projects to recognize their efforts, and to encourage students and staff to engage even more in the community. However, while the program encouraged quite a large number of students to engage in a variety of projects, there were nevertheless a number of issues encountered. For example, students often lost enthusiasm and failed to maintain momentum when they encountered other opportunities or when they were under academic pressure, such as approaching deadlines of assignments and at times of examinations. In addition, students were generally more interested in the action of providing service than the planning and preparation for the project, or reflecting on their experiences or following-up with needed support.

Under the new undergraduate academic structure, students stay in the university for four years. During the first year, students may not be ready to engage heavily in services. During the final year, they may focus on graduation and looking for jobs or graduate schools. Hence, there is only a 2-year window when students are available for services. Besides, every year is a transitional year for new teachers and leaders in service-learning. Given these constraints, it may be difficult to maintain consistency and develop long-term projects and collaborative relationships with partners and communities.

Credit-Bearing Service-Learning Subjects

Service-learning has certain similarities with, but is not the same as, volunteer work. While volunteer work stresses service without compensation or reward, service-learning calls for a balanced approach integrating community service with learning, and emphasizes learning through participation in services [8]. Hence, students' self-reflection and assessment are critical elements of service-learning [9].

At PolyU, a relatively broad definition of service-learning is adopted. It primarily focuses on activities that serve people directly, but it also covers indirect service activities relating to civic responsibility and engagement. It can include direct service activities such as tutoring children in poverty, construction for remote villages, and health education for under-developed communities as well as indirect services such as field research on sustainable

development and advocacy for social justice. Both local and offshore activities are included. The students' achievement of academic objectives is then revealed by academic credits.

PolyU is a comprehensive university with a wide range of disciplines. Each academic program is typically composed of Discipline-Specific Requirements (DSR) and General University Requirements (GUR). GUR includes languages and general education subjects, with 30 credits. As part of GUR, any academic department can design a 3-credit Service-Learning subject. It may target general issues such as poverty relief or assisting the elderly. It may target more specific issues such as assistive devices for the handicapped, housing problems, or dyslexia. It may require generic skills such as communication in English and Chinese, or it may require discipline-specific skills such as bridge-building, accounting, nursing or graphic design. In short, an academic subject qualifies as a SL subject if it has clear academic objectives and expected outcomes for the students, which may be generic, discipline-specific, or both.

There are four common learning outcomes for SL subjects. These include application of knowledge and skills they have acquired in the service setting, reflection on their role and responsibilities both as a professional in their chosen discipline and as a responsible citizen, demonstrating empathy for people in need, and an understanding of the linkage between the academic content of the subject and the needs of society. For each SL subject, we expect students to undertake a SL project of at least 40 hours under supervision and to conduct rigorous student reflections on the linkage of their studies to the needs of the community and the services, their personal role and growth, and the impact of their services.

Categories of SL Subjects

Based on literature and the experiences of other universities, we can achieve the common SL learning outcomes in many different ways. Each subject may differ in the background of the students, the associated academic discipline, the type of services involved, the type of clients served, the location, etc. By 2016, four years after the policy came into effect, 25 out of 29 academic departments at the university are offering at least one SL subject. Table 1 shows some examples of subjects designed for students with different backgrounds.

Broadly speaking, there are two major types of SL subjects. There are "general education" types (referred to as General University Requirement, GUR) subjects. They attempt to enhance students' general knowledge. They do not require specific pre-requisite subjects or knowledge beyond what an average undergraduate student should know. Hence, many GUR subjects are open to all undergraduate students without pre-requisites. However, there are some GUR SL subjects designed for students with certain backgrounds, such as engineering, health-related disciplines, and business. We expect these subjects contribute to the general education of students of that particular background. On the other hand, there are other subjects designed for students in a specific discipline, such as Optometry, English, Biomedical Engineering... etc. In these subjects, we expect students specializing in professional disciplines to use their specialist knowledge to serve and enhance their professional expertise. Students in their senior (i.e. third or fourth year) typically take such subjects.

All SL subjects, including those that are open to all students, are expected to have strong academic objectives and learning outcomes. Students are given rigorous training in the academic elements and relevant skills prior to engaging in the prescribed community service projects. Besides, they are rigorously assessed in the achievement of the expected learning outcomes. For example, the “Technology Beyond Borders” subject is focused on information technology. One of the main topics of study is the “digital divide” between communities with advanced IT technologies and those who are without. Students learn about the digital divide, appropriate technologies and methods for bridging it, and then participate in service projects applying those technologies and methods.

The wide range of SL subjects on offer can counteract the negative consequence of the compulsory nature of the SL requirement. Some students object being required to take a subject they may not be interested in fulfilling the SL requirement. Even among those who are positive about community service, some may still resent being compelled to “do something good”. Obviously, the wide range of subject contents, locales, service types available provides students options and a sense of control.

Table 1. Examples of service-learning subjects

Sample service-learning subjects	
GUR subjects open to all students	• Building green communities with environmental NGOs • Engaging fashion as a communication media for the needy • Growing resilience of children in post-disaster areas • Preserving Cultural Heritage for Ethnic Minorities in Contemporary China • Promotion of Children and Adolescent Development • Serving the Community through Teaching English • Social Justice in Private Housing Redevelopment • Technology beyond borders: service-learning across cultural, ethnic and community lines
GUR subjects for students with certain backgrounds	• Built Environment Enhancement for Underprivileged Communities • Community Psychology • Comprehending and Overcoming Learning Hurdles in STEM for Local Schools • Financial literacy for low-income youths • Helping Primary Students with Specific Reading Difficulties • Promotion of Healthy Ageing in the Community • Serving people with special needs through assistive technology
Discipline-specific subjects	• Accounting and Internal Control in the Elderly Centre through Service Learning • Community Tourism: Tour, Training, Operator, and Event from and for the Community • Enabling occupation in home and community practice • Indoor Environment for Serving the Elderly • Public health optometry • Teaching Chinese as a second language • Teaching English as a Service Learning Experience

Class Size of SL Subjects

The first strategic decision regarding service-learning was to make it credit-bearing. The second was to make it compulsory for all undergraduates. There are two major arguments for the decision. Firstly, the learning objectives of civic responsibility, social justice and ethics are critical components of all-round education, and hence should be required of all students. Secondly, the requirement provides an opportunity for those who would not volunteer for community service.

Table 2. Complementary roles of sub-committee on Service-Learning Subjects (SCSLs) and the Office of Service-Learning (OSL)

Sub-committee on SL Subjects	Office of Service-Learning
Vetting of subject proposals	Assisting in development of proposals
Formulating of policies and procedures	Administration of policies and procedures
(developing) Quality Control	Assisting in the teaching of SL, execution of service projects, and other support activities

These two decisions create a need for large numbers of SL subjects and places for students. At many colleges and universities, service-learning is carried out in the form of small classes with around 20 students. Usually the students select the SL subject or project voluntarily. They are highly motivated. Hence, the subjects may not be very structured, allowing a high degree of autonomy for the students in designing and carrying out their projects. Many of the SL subjects at PolyU fit this pattern. However, the offering of service-learning subjects to large classes (e.g., over 100 students) is a unique feature of SL at PolyU. This is a result of both necessity and design. Primarily, as there is a need to provide thousands of places each year for the students who are required to take SL subjects, there is a need for large classes. Besides, some of these students may not be as highly motivated even though they can choose a subject from a wide variety of SL subjects. Hence, there are some SL subjects in which the service projects are highly structured, which can also accommodate a large number of students.

For example, we take BME2S01 (Scientific Literacy for Low-Performing Students) as an example, which enrolls 100 students annually. The arrangement is to send 50 PolyU students to one secondary school, with 10 PolyU students in one classroom for 50 secondary students to help the secondary students carry out pre-designed science projects. Another 50 PolyU students will go to another secondary school doing similar projects. Within this structure, there is a lot of room for autonomy and self-initiative. PolyU students are given a general topic for the science project (e.g., Grade 8 physics using the Arduino platform), and they develop the project details, procure the materials, write the lesson plans and worksheets, etc. This arrangement is a balance between providing the structure and discipline to support a large number of students, while at the same time providing sufficient room for the students to learn to be independent and innovative in problem solving.

Quality Assurance and Control

With such a broad diversity of subjects and staff, it is important to have a process for assuring the quality of the student learning experience. To this end, we formed a committee on service-learning subjects with the objective to oversee the offering of SL subjects at the university. The committee is composed of faculty members from diverse faculties and departments, who are experienced in SL and general academic matters. The composition of the committee ensures representation of a broad spectrum of disciplines and departments and presence of balanced academic viewpoints. The committee invites proposals for new subjects, vets the proposals and finally recommends them for implementation.

The committee works closely with the Office of Service-Learning (OSL), which is the operational arm of the support structure. The OSL assists departments in developing subject proposals, projects, and student supervision. Table 2 shows the roles of the committee and OSL.

The decision to make SL credit-bearing and compulsory was made in December 2010, with the decision applicable to the first cohort of students entering in 2012. Since 2011, the main goal of the committee and OSL was to promote and develop SL subjects. In each year, the University approved approximately 15-20 new subjects. By December 2015, there were 58 approved subjects from 25 academic departments. While the University will continue to develop new subjects, the focus will also shift to evaluation, consolidation, and research on evidence-based SL.

The fact that multiple departments offer SL subjects poses particular challenges in quality control. The existing practice is that departments are responsible for quality control of the subjects that they offer. However, as most departments offer only a few SL subjects, there is an on-going discussion on whether it is preferable to have a centralized unit to oversee the operation of SL subjects across campus and to ensure parity across the multiple subjects. There is also an on-going teaching development project on the evaluation of SL subjects, which will provide research-based input to the development of a rigorous academic quality control process for SL.

OPERATIONAL SUPPORT

When the SL requirement became reality in 2012, a few departments were already experienced in SL mainly because of the nature of their discipline. Most of these departments are in the health sciences, such as social work, nursing and rehabilitation sciences. Some other departments, such as computing and biomedical engineering, had acquired some experience because of their own initiatives. Most of the other departments and their staff, however, were relatively inexperienced. Therefore, it is important for the University to provide needed support for developing subject syllabi, teaching methods, and service projects, etc. This need is also evident from studying practices at many leading universities. Hence, the University established the Office of Service-Learning to provide central support and coordination.

Office of Service-Learning (OSL)

The OSL advises departments and academic staffs on various matters related to OSL. These include development of subjects and projects, liaison with non-government organizations to find suitable projects for the teachers, liaison with funding agencies and donors to support projects, offering of staff development workshops and courses, and organization of exploratory projects.

Working closely with the committee in charge of vetting subject proposals, the OSL also developed an eLearning module for students, which covers basic concepts of service-learning that can be used as a core part of a SL subject. The module lasts for 10 hours and it has been integrated into many SL subjects. It reduces the teaching load of the teaching staff, ensures some consistency in teaching, and promotes the implementation of service-learning.

Collaboration with External Partners

In most cases, we carry out service projects in collaboration with external organizations, such as non-profit organizations, primary schools, secondary schools, and other universities. In some cases, PolyU staffs are responsible for designing and planning the majority of the project, while the external partner contributes little. For example, in some projects aiming at reducing the “scientific divide,” the collaborating schools are responsible for selecting the participating students and scheduling the sessions and venue. The PolyU staffs are in charge of the service projects, including designing the projects, providing the project material and notes and transportation for the students.

In some other projects, the external partner may play a much more significant role. This is particularly true for offshore projects in the Chinese mainland or overseas. For example, one of our projects in rural development collaborates with a university in Indonesia. Our partner institution has a strong service-learning program of their own as well as good connections to the local government and many villages around Yogyakarta, and their students speak the local language. In this particular case, the local partner takes many initiatives in the planning of the services, selection of villages, logistics, accommodation in village homes, interpretation, etc. Our faculty members work closely with the local university, and retain full control in supervising and assessing our students in the execution of the service projects. The middle part of Figure 1 shows this arrangement.

Figure 1. Collaborative relationship between university and service-learning partner.

Many of the projects are in between the “scientific divide” case (i.e., PolyU has practically full control) and the “Indonesia” case (i.e., our partner doing much of the planning and logistics) in Figure 1. For example, we have sent teams to Cambodia since 2010 and have built up many good contacts and a good understanding of the local transportation and accommodation. Hence, we are able to control a lot of the planning, selection of projects, logistics, etc., although we still have to rely on our local partners for liaising with the target community and interpretation. At the same time, we are helping some of our partners to build up their service-learning capacity and experience. This case is positioned about 25% from the left edge of the diagram in Figure 1.

We discourage and we have never approved service-learning projects that give complete control to our external partners. Given that service-learning is a core requirement of the University, it is imperative for the learning outcomes and the learning experience of our students that the design of the project is an integral part of the subject, which makes outsourcing to external partners inappropriate. Hence, the range of collaborative relationships supported in the PolyU model covers generally the left half of the diagram in Figure 1.

Staff Development

Prior to the implementation of academic credit-bearing SL in 2011, there were few faculty members who had significant experience in developing, delivering and assessing credit-bearing service-learning. At full implementation, we probably need around 100 teachers to teach around 60 SL subjects, some of which may need two or more teachers to co-teach because of the large class size, heavy supervisory duties, or the multi-disciplinary nature of the subject or services. Hence, staff development is critical [10]. In the past years, we have developed several initiatives on staff development.

Workshops and Seminars

From the start, workshops and seminars were heavily used to promote the concept of service-learning as well as to educate staff on different aspects of teaching an SL subject. These seminars were organized on a monthly basis on a broad range of topics, including policy on service-learning, how to write a syllabus, how to assess students’ performance, etc. At the beginning, outside speakers were invited. As colleagues gained more experience, speakers experienced in various aspects of SL within PolyU are leading these workshops.

E-Learning

An eLearning short course for staff was developed and implemented in September 2012. It takes 3 hours to complete and covers the basic concepts, advantages, myths, subject and project development guidelines, samples of SL subject syllabi and projects [11]. More than 50 staff members have since taken the eLearning course. An evaluation survey found that overall satisfaction with the eLearning short course was around good (4 points out of a maximum of

5 points). Many who have taken the course have gone on to propose and teaching SL subjects. We have also shared the e-learning module with colleagues from other institutions.

In addition, we have developed an eLearning module covering basic concepts of SL. It takes 10 hours for the student to complete. Many SL subjects incorporate the eLearning module in the curriculum where students will take this at the beginning of the term. The module has two major purposes. First, it reduces the workload of the subject lecturer. Second, it ensures that there is a consistent coverage of the core concepts of SL across SL subjects. Many subject lecturers apply the inverted classroom method with the eLearning module: after the students complete the eLearning module, teachers hold a face-to-face classroom discussion to discuss the concepts introduced in the eLearning module, in more depth.

Practical Experience and Training

Colleagues who are interested in SL are given opportunities to participate in service projects to acquire hands-on experience. Starting in 2011, we have invited a small number of colleagues to participate in some of our more “mature” projects as observers or assistants, such as the Cambodia off-shore service-learning project. A practical experience short course was offered for the first time in summer 2013, and repeated in 2014. Several colleagues who participated have come back to become strong advocates and supporters with SL subjects of their own.

In 2016, 17 staff members from both academic and non-academic departments participated in a staff project in Cambodia. They visited a number of student projects to observe the students’ service and carried out their own projects on helping to set up a community learning center. Some of the colleagues were already involved in teaching SL subjects in Hong Kong or proposing new subjects. They found the experience valuable in understanding what it takes to operate an overseas SL project. Staff with administrative responsibilities found it valuable in understanding SL and helpful in promoting and supporting SL from their own posts, such as in publicity, fundraising, and in general supporting the operations of SL subjects in academic departments. Overall, it is an important step towards staff participation in service-learning and embedding SL as a core value of the university.

Community of Practice

A community of practice has been nurtured as a platform for staff to share experiences, collaborate in exploratory projects and research, and to promote the practice of service-learning. As mentioned earlier, SL subjects exist in a wide range of departments, with some departments having relatively few colleagues engaging in SL. To provide support to our SL faculty members, we have created an institution-wide community of practice. The community has a modest budget for supporting small-scale projects, attendance at conferences, etc. Regular gatherings encourage colleagues to share experiences and information on writing proposals for new subjects, seeking funding, and assessing student performance. Such gatherings are usually well-attended, testifying to their usefulness. Members of the

community have proposed SL subjects and projects, participated in the organization of conferences, and become the prime movers of SL across the university.

FUNDING SUPPORT

One of the core strategies of credit-bearing service-learning is that SL subjects are offered and funded like other academic subjects. In addition, it is recognized that service-learning involves a significant amount of activities conducted outside the classroom. Hence, there may be a need for additional resources for supporting the subject delivery, such as field supervision, travelling and equipment. Because of the special nature of SL subjects, the total funding of SL subjects is approximately 30% higher than other GUR (general education) subjects.

Project and Travel Expenses

While around 80% of our students participate in service-learning projects in Hong Kong, an increasing number are serving in offshore projects beyond Hong Kong. These include sites in the Chinese mainland, as well as foreign countries such as Cambodia, Indonesia, Vietnam, Myanmar and Rwanda. These projects serve multiple purposes in addition to learning through service. To begin with, Hong Kong is geographically very small and relatively racially homogeneous. In addition, many of our students are from working-class backgrounds without any travel experience outside Hong Kong. This means that many of them have not previously had experience interacting with peers from a different race or culture for an extended period. Offshore projects therefore afford students an additional learning experience from interacting with people from different cultures and races. For projects that involve appropriate technology, they also afford students the opportunity to work in a low-resource environment.

Offshore service-learning projects necessarily incur additional costs beyond that of a conventional academic subject, and even beyond that of local service-learning subjects. While the University is expecting the students to cover part of their own costs to ensure ownership and accountability, it also raises funds to subsidize the students' expenses. It is encouraging to witness that many donors, both individuals and institutions, are quite willing to donate generously to fund SL projects. Since 2011, donations of more than US\$3 million to support service-learning projects have been received.

INTERNATIONAL SERVICE LEARNING

Hong Kong is a small and relatively homogenous society. Internationalization of our SL projects is important for many reasons, not the least for broadening the students' experience and benchmarking. In 2012, while the University was making a major effort in developing SL subjects, the University organized the first University Social Responsibility Summit, with the participation of senior administrators from a number of prestigious universities active in the field. In 2014, the second submit was organized, in conjunction with the first international

conference on service-learning organized by the University. In 2015, the USR Network was formally launched, with 14 founding members. By then, SL has been firmly established as a major component of the social responsibility initiative of the University.

In summer 2016, USR Network member universities sent nine students to participate in PolyU's SL projects. Eight of them (from Washington University in St Louis from the USA, Haifa University from Israel and Sichuan University from China) participated in the Cambodia project organized by the Department of Computing. They joined 30 students from PolyU and another around 30 students from two institutions in Cambodia. Supported by around 10 colleagues, the team went through a week of training at a local university and then carried out a range of technology-based projects, including installation of four solar power stations where they used solar panels to charge car batteries. Besides, they wired up 15 households where car batteries charged at the charging stations were used to power LED lights and phone chargers and maintained six charging stations and around 30 households set up in 2015. In addition, they installed two used containers as a community learning center. In the learning center, they installed solar-powered electrical fans, LED lighting, and a rain-collection system. They also made furniture, set up computers and Internet access via SIM cards. Throughout the week, the whole team stayed in village homes in a home-stay program. The project enabled the 80 students from seven educational institutions from Hong Kong, China, the USA, Israel and Cambodia to bond with each other through an intense serving and learning experience. This project serves as the prototype of an international summer institute of SL and leadership that we are planning to start in summer 2017.

In addition, there are also a number of other initiatives in internationalization of SL. The Biomedical Engineering team has long been collaborating with the Washington University in St Louis and the University of Pennsylvania on a project serving handicapped people in southern China. The Department of Computing launched a joint SL subject with the University of Maryland, combining technology-based services with community need assessment in Rwanda. The Office of Service-Learning launched a SL journalist project with a team composed of students from Brown University and the PolyU as a new initiative in development communications.

SELECTED CASE STUDIES

The previous sections describe the background of the service-learning initiative at The Hong Kong Polytechnic University. In this section, we will describe some representative projects.

Technology Beyond Borders: Addressing the Digital Divide

This is one of the first credit-bearing SL subjects as well as one of the most ambitious ones. The subject aims to enable students from across the university to learn about the impact of (actually the lack of) information technology on communities and how technology can be used to empower developing and underprivileged communities. The students start with the eLearning module on basic concepts of service-learning. Then they learn the various aspects

of the digital divide in several lectures: hardware, software, access to the Internet, education, ethical issues, use of appropriate technology to tackle problems in the developing world, addressing the needs of underprivileged communities such as those who are disabled.

The subject is open to all students with an enrollment of 100-150 students every year. The students come from disciplines such as engineering, science, language, finance, nursing, design, etc. The students then form project teams based on their preference as well as the needs of the project. In 2015-16, there are projects with different communities in five locations. These include assistive devices for handicapped children in special schools in Hong Kong, solar power and a community learning center for villagers without electricity and water in Cambodia, technology-based projects for a secondary school in rural Myanmar, solar power and a community learning center in villages without electricity and running water in Rwanda, and technology-based projects for schools in Kyrgyzstan. Then the students attend specific lectures and workshops about the target communities of their projects. These workshops cover the historical and cultural background of the target community as well as the technical contents of the project. For Cambodia and Rwanda, we discuss the genocidal civil wars and their impact on the country.

After the training, students are then ready for the service-project. These typically take place in May and June after the end of the second semester, with supervision and support from the teaching team consisting of professors and teaching assistants/SL officers. We hold debriefing and sharing sessions throughout the service period to assist the students in reflecting on their experience, making observations, asking probing questions and making adjustments in their service projects. The students write journals and reports individually and collectively. Teachers assess the three aspects of the project (preparations, execution, and reflections) as part of the overall grading.

This subject has been running since 2011. In the process, we have developed strong collaboration relationships with a number of collaborating organizations and universities in the various locales. These relationships have led to long-term projects. It has also facilitated the setting up of other projects in these locales, by departments such as Optometry, Hotel and Tourism Management, Nursing, and English Learning Center. It has also led to several international collaboration projects with foreign universities mentioned above.

Engaging Fashion as a Communication Media for the Needy

This is a subject offered by the Institute of Textile and Clothing. It is open to students from all disciplines. After studying the core concepts of SL through e-Learning, students learn a number of fashion design concepts such as trends, sourcing, taking measurements, basic garment patterns, fitting and sewing. They also learn fashion creativity as communication media, social perception and social influence of fashion on community. Students then form teams to plan, co-ordinate, teach and conduct small workshops for elderly, disabled or ex-mental patients on fashion design and styling as well as garment making, and assist the service recipients to create and style an outfit. The teachers and students will then showcase the creative works derived from this project in an exhibition within the PolyU campus and/or a mini fashion show at a public venue or within the university. Professional photographers engage in photography sessions to create portfolios for the clients. Finally,

students write reflective journals and reports to link their service-learning experiences with the academic focus/discipline-specific content of the subject, reflect on their service-learning experience to identify their learning gains as well as areas for future improvements, and reflect on their roles and social responsibilities.

The project approaches fashion creativity as a form of caring tool and help service recipients build inner confidence in utilizing their personal creativity to create a fashion outfit and enhance their personal fashion image. The project has been running for several years and receives very good feedback from students, clients, partner NGOs funding agencies and the government.

EVALUATION BASED ON THE FIRST FOUR YEARS

Initially, we estimated that an average SL subject could accommodate 50 students. As such, we need to offer around 60 subjects each year to accommodate all the 2,800 students in full-time 4-year undergraduate degree programs needing to take a SL subject, when the initiative is in full implementation. Since then, the University has decided that the requirement also applies to the “senior year” students who enter these 4-year programs with advanced standing, typically after completing an associate degree at a community college. This raises the total number of students who have to take a SL subject to around 4,500 each year.

Since spring of 2011 until May 2016, we had developed and approved 60 subjects (see Figure 2). Not surprisingly, many departments in health and social science offer the related subjects. However, it is also encouraging to see departments in engineering as well as construction and environment offer SL subjects. In fact, all faculties and schools are now active in offering service-learning.

Impact on Students

In the academic year 2015-16, around 3,790 students enrolled in SL subjects. Amongst them, 75% of them participated in projects in Hong Kong, about 18% of them served in projects in the Chinese mainland, and 7% served in overseas countries, mostly in South-East Asia, and a few as far as in Kyrgyzstan in Central Asia and Rwanda in East Africa (see Figure 3). Students completed a questionnaire before and after they had taken their SL subjects. At the time when we wrote this chapter, we had collected data from around 2,000 students who had completed one of 55 credit-bearing SL subjects, and the preliminary results are quite encouraging (see Figure 4).

One distinguishing characteristic of the SL requirement at PolyU is that it is mandatory for all undergraduate students. To understand the impact of the mandatory requirement on the students, we have also conducted a 2-part study. Part 1 is a quantitative study of the correlation between the students’ response to an online survey of their learning experience and the students’ subject grade. Part 2 is an in-depth individual interview with 46 students randomly selected. The conclusion from the analysis indicated that students as a whole did learn quite a lot from the mandatory SL requirement. Interestingly, the “less-inclined”

students learned almost as much as those who were “more-inclined”. Results also showed that quality of learning experience, and to a less extent, their interest in the subject, had a much stronger impact than their initial inclination on their learning and development from SL. Finally, most students, particularly those who adopted a negative or “passive acceptance” stance, reported a very positive change in their views on SL after taking the subject (see Figure 5).

Figure 2. Number of SL subjects approved, offered by each faculty/school.

Figure 3. Distribution of students by (left) service location and (right) international projects.

Figure 4. Students' self-evaluation of generic skills before and after taking SL.

Figure 5. Changes in students’ view about SL after taking SL subject.

The objective of the SL initiative at PolyU is not only for students to take a SL subject. Instead, it attempts to cultivate a culture of civic engagement and social responsibility at the University. It is encouraging to observe that some of the students who have taken a SL subject have returned to participate in service projects as student assistants and leaders, organized their own service projects, and even developed their own organizations in community service. The University is developing a number of mechanisms, including scholarships, internship opportunities, and participation in SL-related conferences, to encourage and support students in furthering their involvement in service-learning. A student SL Network has been set up as an umbrella organization for a number of student clubs on a variety of themes in SL, such as Cambodia, Technology for Development, Drones for STEM, Rehabilitation Services in Rural China, and Volunteer Teaching in China.

Impact on Staff and the University

When the SL initiative was proposed, there were many doubters and sceptics. Fortunately, in the past several years, there are encouraging signs that more staff members are actively involved. There is now a Community of Practice on SL with 50+ core members. Starting with just a handful of staff, we have now around 150 academic staff involved in the teaching of 60+ subjects annually. We also see an increasing interest from alumni, individuals and organizations external to the university, which is concretely reflected in the increasing amount of donations dedicated to service-learning. The amount of funds needed to send the 900+ students to mainland China and overseas is estimated to be approximately 10 million Hong Kong dollars per year, financed mainly by donations, government funds and the students’ own contributions.

CONCLUSION AND FUTURE WORK

Starting from scratch in 2011, the SL initiative has been largely progressing on schedule. This is the result of adopting best practices from leading universities, determination and strong support from the senior management, clear and balanced policies, the effort of a number of enthusiastic advocates, and most importantly, support from a broad spectrum of staff and students from across the university.

Nevertheless, from the experience in the past three years, we have identified a number of issues requiring attention. The first issue is on quality assurance. There is a need to ensure that the subjects offered are genuine SL subjects and teachers teach the subject according to its design, and the assessment is consistent across subjects. Second, there is a need for funding support. Many subjects, particularly those involving travelling and equipment incur significant expenses. We need to ensure stability of funding for long-term operation of the program. Third, we should further explore appropriate pedagogy to develop appropriate teaching methods for different types of SL subjects, particularly for students who do not necessarily participate voluntarily. In the past years, we have learned a few lessons. However, we have to ensure that the students derive maximum benefits from the SL requirement.

ACKNOWLEDGMENT

This chapter is based on a paper to be published in the *International Journal of Child and Adolescent Health*.

ABSTRACT

There are many issues confronting the contemporary world that adversely affect the quality of life of human beings, living creatures and the environment. With reference to these problems and the notion of “corporate social responsibility,” it is argued that universities have to develop the culture of “university social responsibility” (USR) to tackle these problems to promote the quality of life. In this chapter, it is argued that universities should engage in USR activities through teaching, research and services. Issues surrounding the role of USR in the promotion of the quality of life are discussed.

INTRODUCTION

The traditional image of a university is to generate advanced knowledge of complex nature. The term “higher” education clearly describes this point. Hence, the traditional image of a university is also an “ivory tower” where there is a wide abyss between “ordinary” people and “learned” intellectuals in the university. However, there are more people including academics arguing that the role of the university and academic pursuits is not just conducting intellectual exercises, such as asking the question of what “truth” is. The community is asking how academic knowledge can promote the quality of life for human beings, living organisms, communities, countries, regions, and the global world.

In the good old days when few people studied at universities, getting “good jobs” after graduation was not a problem. However, with more young people going to university and competition for jobs becoming more intense, some universities have changed to vocational training “factories” to equip students with vocational skills. While there is nothing wrong with this approach, over-emphasis on job preparation would necessarily constrain the mindset of students to form a narrow conception about the social responsibilities of university students. Besides, university students might become more egocentric focusing on tangible outcomes of university education. Hence, there are views arguing against such over-emphasis on the job preparation function of universities.

It is not uncommon to see that universities focus on the promotion of the quality of life as a vision and/or mission of universities. As shown in Table 1, many universities throughout the world attach great importance to the promotion of the quality of life as part of the duty of a university. While these are noble statements, how can universities promote the quality of life of human beings, living creatures and the environment? In this chapter, we will discuss how universities can possibly promote the quality of life through teaching, research and service. We will also identify issues surrounding university’s role in the promotion of the quality of life. According to Shek and Lee [1], the quality of life (QOL) is a multidimensional approach incorporating material well-being (e.g., income, living quality), physical well-being (e.g., health, fitness, personal safety), social well-being (e.g., personal relationships, community engagement), emotional well-being (e.g., mental health, life satisfaction, self-esteem), and productive well-being (e.g., competence, productivity).

Problems Confronting the World

There are many problems confronting the world which adversely affect the quality of life for human beings, living creatures and the environment. Based on an extensive review of the literature [2-6], there are ten key global challenges which are faced by the human race. The first challenge is abrupt climate change. There is a growing body of evidence that human activity since the industrial revolution has significantly increased the production of greenhouse gasses [7] which has led to a warmer Earth. Extreme high temperature does not only kill people, it also adversely affects agriculture and infrastructure [8]. The second global challenge is food security which occurs as a result of the rise in population size and catastrophic climate change. Searchinger et al. [9] pointed out that food production needs to be increased by 50-100% in order to meet the demand. According to the Food and

Agricultural Organization [10] of the United Nations, there are still 795 million people undernourished, although the prevalence rate of undernourishment has decreased globally from 18.6% in 1990-92 to 10.9% in 2014-16. The third global challenge is related to water and sanitation which are recognized as a basic human right by the United Nations General Assembly [11]. Around 9% of the global population does not have access to an improved source of drinking water [12]. Regarding sanitation, around 50% of people in rural areas lack improved sanitation facilities, while only 18% of people in urban areas lack them.

Table 1. Promotion of quality of life focus in the vision and mission statements in different universities

University		Promotion of quality of life focus
1	California Institute of Technology	"to expand human knowledge and benefit society through research integrated with education" (http://www.caltech.edu/content/caltech-glance)
2	University of Oxford	"We seek to do this in ways which benefit society on a national and a global scale." (https://www.ox.ac.uk/about/organisation/strategic-plan?wssl=1)
3	University of Cambridge	"to contribute to society through the pursuit of education, learning, and research at the highest international levels of excellence." (https://www.cam.ac.uk/about-the-university/how-the-university-and-colleges-work/the-universitys-mission-and-core-values)
4	Massachusetts Institute of Technology	"to advance knowledge and educate students in science, technology, and other areas of scholarship that will best serve the nation and the world in the 21st century." (http://web.mit.edu/facts/mission.html)
5	Harvard University	"to educate the citizens and citizen-leaders for our society" (https://college.harvard.edu/about/history)
6	Princeton University	"with a pervasive commitment to serve the nation and the world" (https://www.princeton.edu/main/about/mission/)
7	Yale University	"to improving the world today and for future generations" (http://www.yale.edu/about-yale/mission-statement)
8	University College London	"to transform how the world is understood, how knowledge is created and shared and the way that global problems are solved" (http://www.ucl.ac.uk/ucl-2034)
9	Columbia University	"to support research and teaching on global issues" (http://www.columbia.edu/content/mission-statement.html)
10	University of California, Los Angeles	"the creation, dissemination, preservation and application of knowledge for the betterment of our global society" (http://www.ucla.edu/about/mission-and-values)
11	University of Toronto	"with vigilant protection for individual human rights, and a resolute commitment to the principles of equal opportunity, equity and justice" (https://www.utoronto.ca/about-u-of-t/mission)
12	Duke University	"to contribute in diverse ways to the local community, the state, the nation and the world" (https://trustees.duke.edu/governing-documents/mission-statement)
13	University of Edinburgh	"make a significant, sustainable and socially responsible contribution to Scotland, the UK and the world, promoting health and economic and cultural wellbeing." (http://www.ed.ac.uk/about/mission-governance/mission)
14	University of Melbourne	"contributing to society in ways that enrich and transform lives" (http://about.unimelb.edu.au/__data/assets/pdf_file/0006/1462065/11364-GROWING-ESTEEM-2015-FA-WEB.pdf)
15	University of British Columbia	"supports outstanding research to serve the people of British Columbia, Canada and the world." (http://strategicplan.ubc.ca/the-plan/vision-statement/)

Table 1. (Continued)

University		Promotion of quality of life focus
16	The University of Tokyo	"aims to expand the boundaries of human knowledge in partnership with society." (http://www.u-tokyo.ac.jp/en/about/mission.html)
17	The University of Hong Kong	"to attract and nurture outstanding scholars from around the world through excellence and innovation in teaching and learning, research and knowledge exchange, contributing to the advancement of society" (http://www.hku.hk/about/vision.html)
18	Washington University in St. Louis	"strive to enhance the lives and livelihoods of students, the people of the greater St. Louis community, the country and the world." (https://wustl.edu/about/mission-statement/)
19	Brown University	"to serve the community, the nation, and the world by discovering, communicating, and preserving knowledge" (https://www.brown.edu/about/mission)
20	University of Sydney	"leading to improve the world around us" (http://sydney.edu.au/about-us/vision-and-values.html)
21	Hong Kong University of Science and Technology	"to contribute to the economic and social development of the nation as a leading University in China" (http://www.ust.hk/about-hkust/hkust-at-a-glance/mission-vision/)
22	University of Southern California	"the development of human beings and society as a whole through the cultivation and enrichment of the human mind and spirit" (https://about.usc.edu/files/2011/07/USCRole_and_Mission_Statement_1993.pdf)
23	University of Glasgow	"We should use our work to benefit and enhance Glasgow, the West of Scotland and the global community wherever possible." (http://www.gla.ac.uk/about/strategy/visionandmission/values/)
24	Kyoto University	"to sustain and develop its historical commitment to academic freedom and to pursue harmonious coexistence within the human and ecological community on this planet" (http://www.kyoto-u.ac.jp/en/about/profile/ideals/mission.html)
25	University of Wisconsin-Madison	"transmit the knowledge, wisdom and values that will help ensure the survival of this and future generations and improve the quality of life for all" (http://www.wisc.edu/about/mission/)
26	Tsinghua University	"dedicated to the well-being of Chinese society and to world development." (http://www.tsinghua.edu.cn/publish/newthuen/newthuen_cnt/about-th/about-1.html)
27	University of Texas at Austin	"to transform lives for the benefit of society" (http://www.utexas.edu/about/mission-and-values)
28	Boston University	"committed to generating new knowledge to benefit society" (http://www.bu.edu/info/about/mission-statement/)
29	University of Minnesota	"to engage our students, faculty, and staff in addressing society's most pressing issues" (https://twin-cities.umn.edu/about-us)
30	The Hong Kong Polytechnic University	"To learn and to apply, for the benefit of mankind." (http://www.polyu.edu.hk/web/en/about_polyu/motto_vision_mission/ind ex.html)

The fourth global challenge is population growth and aging. According to the Department of Economic and Social Affairs of the United Nations [13], the global population reached 7.3 billion in mid-2015, and will reach 9 billion by 2043 and 10 billion by 2083. Obviously, population growth imposes high demands on the Earth's resources. In addition, because of low mortality and low fertility rate, the global share of older people aged 60 years or older has already increased from 9.2% in 1990 to 11.7% in 2013. The rate is expected to grow continuously and reach 21.2% by 2050 [14]. This continuous growth of the general population and the aging population give tremendous pressure to the social and economic

system. The high dependency ratio will create a huge pressure on social security as well as health care demands.

The fifth global challenge is gender inequality. Despite the increased awareness of gender equality and the related effort to improve the status of women in recent decades, a huge gender gap in economic participation, political empowerment, health access and educational attainment still exist across the world [15]. It is estimated that the gap in economic opportunity between women and men will only close until 2133, which will take 118 years to complete. Besides economic inequality between men and women, violence against women is a serious problem globally [16]. Furthermore, according to United Nations Children's Fund [17], in 2050 more than 700 million females were still married as children and they were often vulnerable to early pregnancy and sexually transmitted diseases.

The sixth global challenge is inequalities in economic growth. Despite the existence of poverty reduction [18], there is a rise in income inequality around the world. As shown in the report published by Credit Suisse [19], the richest 1% of people have accumulated more wealth than the rest of the people of the world altogether. The Oxfam also found that the inequality has been getting worse in the recent years [20]. Obviously, the widening of income inequality leads to many serious economic and social problems [21]. The seventh global issue is unemployment. Actually, since the financial tsunami in 2008, the world economy has not fully recovered. According to Horne and colleagues [22], the global employment outlook will decline in the next five years. In 2015, over 197 million people were unemployed around the world, 27 million more than the pre-crisis level. In particular, unemployment is very serious among young people. In 2015, there were around 74 million young job seekers in the world. Finally, poor job quality remains as a global challenge. Workers in vulnerable employment have increased by more than 27 million since 2012 and reached 1.5 billion people worldwide.

The eighth global issue is new emerging diseases, such as H5N1 avian influenza. Since 2003, 584 confirmed cases of H5N1 avian influenza have led to 345 deaths [23]. If H5N1 would transmit easily between humans, the estimated death toll of an H5N1 pandemic could reach 1.7 billion fatalities [2]. Recently, Ebola and Zika viruses have also created a great challenge for the world. The ninth global challenge is war and conflict. While emergent diseases are typically beyond human control, war and regional conflicts are largely man-made. According to the Global Peace Index (GPI) by the Institute for Economics and Peace [24], the world has become less peaceful since 2008, in 2015, there were only ten countries in the whole world which could be considered free from conflicts. Besides, terrorism has grown over the past years. The recent incidents in Western Europe have created much psychological trauma for people around the world. Finally, wars and regional conflicts have created the tenth global challenge – refugees. According to the United Nations [12], every day, 42,000 people are displaced and forced to seek protection due to conflicts [12]. Among all the displaced people, 21.3 million people were recognized as refugees. As a result of the prolonged nature of conflicts, many of them have been exiled for decades and have little hope of returning home.

Promotion of the Quality of Life through Teaching

Primarily, university education should focus on nurturing students who have a sense of social responsibility to promote the quality of life among human beings, living creatures, and the environment. Nevertheless, there are growing criticisms about the mission of universities. Sax [25] commented that “higher education was not effectively meeting the challenge of nurturing students’ sense of civic responsibility.” Bringle and Hatcher [26] remarked that Boyer challenges higher education “to reconsider its mission to be that of educating students for a life as responsible citizens, rather than educating students solely for a career.” Similarly, Lewis [27] stated that “over the decades I have heard many academic discussions about teaching, about the curriculum, about grading, about athletics, and about responding to student misdeeds. I have almost never heard discussions among professors about making students better people.” Finally, Lewis [28] also maintained that universities “will not have fulfilled their public obligations simply by adding to the national stock of human capital, no matter how well they achieve that goal. They must recognize a direct responsibility for the civic learning of their students, spread across the curriculum.”

How can we nurture a sense of social responsibility and the importance of promoting the quality of life in students? Basically, there are three ways of doing this. First, messages about the needs of people, living organisms, and the world are directly taught in the formal curriculum. For example, students learn about global warming, inequality, vulnerable groups, conservation issues and even animal rights in their major study and general education exposure. Some subjects such as Service-Learning are vehicles to promote social responsibility and related awareness in students. Second, through co-curricular activities such as community service and conservation projects, students know more about the needs of people and the environment. Third, besides directly teaching students about social issues and indirectly exposing students to the needs of the world, universities should also nurture students’ moral values (e.g., not greedy) and a sense of care for other people.

Indeed, cultivating caring beliefs and moral values of students are very important. Crosby [29] asked, “What is the most important course in the university?” He argued that while economics, business, mathematics, computer sciences and English were important, the course about “each student’s own life” is the most important course. As he argued, “development of moral character in students is not an appendage, afterthought, or mere by-product of the process of liberal education, but something that lies at its very heart. Proper development of a student’s character can enable that student to see beyond education merely as certification and preparation for a job to the critical awareness of the importance and value of a life that is lived well in all of its dimensions, a life that continues throughout its course to develop and sustain a sense of purpose and fulfillment in oneself and the satisfaction of contributing responsibly and effectively to the well-being of others” (p. 1). However, focus on the moral character of the students is more a lip service than reality in the higher education sector.

In response to the comment of Chickering [30] that universities “have generally ignored outcomes related to moral and ethical development as well as other dimensions of personal development” and “have failed to graduate citizens who can function at the levels of cognitive and moral, intellectual, and ethical development that our complex national and global problems require,” universities should reflect on how we can nurture students’ passion and

compassion about people, and sensitivity about issues surrounding how university students and graduates can promote the quality of life.

Promotion of the Quality of Life through Research

Besides teaching, generation of knowledge through research is another basic duty of universities. Fundamentally, universities generate knowledge which changes our conceptions of many issues, which eventually promote the quality of life of human beings, living creatures, and the world. For example, through gender studies, we understand that women are oppressed in many parts of the world. Based on poverty studies, we understand that people tend to blame poor people for their laziness and ignore how exploitation and lack of opportunities may contribute to poverty. In addition, conservation studies tell us that resources on the planets will be depleted if the consumption culture continues. Finally, studies on animals change our views on animal rights and protection of animals. In short, university research generates new knowledge, which changes our views of many things, which would eventually promote the quality of life not just in human beings, but also living things as well as the environment.

Besides transforming our views about things, research in the university also generates practical solutions to human problems that promote the quality of life in people. For example, biomedical research is conducted to investigate the causes of diseases and has made tremendous contributions to generate new ways to improve human health and extend human lives [31, 32]. Advances in biomedical research allow doctors to have a better understanding of the genetic basis of many diseases [33], such as how different combinations of mutated cancer genes could be identified [34]. Research attempting to identify genes of new intellectual disability has also been conducted, which can help to identify developmental disorders as early as possible [35]. Using genetic engineering techniques, bacteria that produce human insulin could be made [36]. Besides, using functional magnetic resonance imaging has decreased the risk for diseases in some heritable disorders [37].

In the areas of engineering and applied sciences (such as applied biology, civil engineering, information engineering), there are numerous examples on how related research can promote the quality of life. For example, the use of optical fiber communication has improved human communication and transport safety through the use of sensors [38, 39]. The application of nanotechnology has produced better clothing and medical treatment procedures [40]. Regarding renewable energy, engineering research has produced solar panels, the wind electricity generators and hydroelectric power generators [41]. Engineering research can also lead to a better irrigation system and crop harvest technology. Finally, urban renewal research has helped policymakers to identify the needs of the community and provide pointers to the details of the renewal process.

In the field of education, research showed that education could promote economic growth in Africa [42] and reduce poverty in Uganda and Costa Rica [43, 44]. Besides, education promotes emotional well-being by improving psychosocial competence such as resilience, self-efficacy, and emotional competence. For instance, the Head Start Program in the United States demonstrated that participants had improved in the cognitive, health, and behavioral functioning [45]. In Hong Kong, multiple evaluation results revealed that Project P.A.T.H.S.

could enhance the well-being of adolescents by reducing risk-taking behavior and other negative outcomes [46].

Social science research also has substantial contributions to the quality of life in human beings. For example, social science research helps to understand the effectiveness of a specific program or policy. Social science research can give sound evidence for a positive psychology intervention to be judged viable [47]. Graham [48] remarked that happiness studies can be an effective tool for tracking the quality of life, welfare, and other well-being measures. Furthermore, research findings can influence the policy-making of government as a useful reference. For example, the concepts of the quality of life are regarded as the backbone policies in Association of Southeast Asian Nations (ASEAN) and the UN Millennium Development Goals. In ASEAN's [49] regional action plan on Healthy ASEAN Lifestyles, it establishes the quality of life in the key policies, such as the 'promotion of social participation,' 'minimizing of discrimination,' and 'enhancement of economic opportunities.' The plan was further incorporated into the ASEAN Socio-Cultural Community Blueprint [50], which means that subjective quality of life has been increased.

Finally, research in humanities (such as history, literature, music) also promotes the quality of life in human beings. For example, some novels (e.g., *Men search for meaning* by Victor Frankl) have provided hope for people in distress. Some literature also helps us appreciate human potentials and strengths (e.g., *Chicken soup for the soul* series) are also empowering. Some musical pieces are composed to empower people or celebrate human achievement. People can also change through music therapy [51]. Through historical research, we can learn the good practices from different cultures and countries, which would eventually promote the quality of life [52]. Finally, arts also promote the quality of life [53].

Promotion of the Quality of Life through Service

Obviously, one direct way to promote the quality of life of other people is to serve them. In many universities, there are community service projects serving the needy driven by volunteerism and support from the university administration. Besides students, employees and alumni are also involved. In this book, there are many outstanding projects undertaken by colleagues in different universities, such as those undertaken by the University of Manchester and University of New South Wales.

In fact, having service to promote the quality of life of others is just an outcome. What is more important is the serving mindset. First, similar to the notion of "corporate social responsibility" (CSR), academics should also emphasize the importance of "university social responsibility" (USR). In fact, academics must see that serving others and promotion of the quality of others as their duties. Without such a paradigm shift, it would be difficult to talk about university social responsibility. Second, we must have a service culture which is treasured by members within the university community.

Issues for Consideration

There are several issues we have to resolve when we propose that promotion of the quality of life is one of the core businesses of universities. Primarily, we have to reconsider the vision and mission of universities. Obviously, universities should not be “ivory towers” or “job training places.” While searching for answers to very academic issues and training students to get better jobs are legitimate, university education without consideration of the needs of the living creatures and the environment is a serious missing.

The second issue is how we should incorporate concepts of USR and QOL in the formal curriculum. Obviously, these concepts are foreign to many teachers with a PhD degree where they conduct in-depth study in their disciplines without really making reference to the promotion of quality of life in people. Hence, there is a need to develop curriculum on how such elements can be incorporated into the formal curriculum, particularly in an indirect way. Innovative pedagogies should also be explored. Regarding intended learning outcomes, it is not just improvement in knowledge about social issues in the world but also the development of positive attitudes towards serving and readiness to promoting the quality of life through serving and contributing to the society.

The third issue is to research on the role of research in the promotion of the quality of life. While it is perfectly legitimate to conduct research for pure academic interests, it is equally important to conduct research that has applied relevance to the quality of life. When universities are driven by ranking, academics may produce work that has no direct relevance to ordinary people in reality. Hence, when we look at “impact factor,” we should seriously look at “social impact factor” as well – how the research may promote the quality of life of other people, living creatures, and the environment. Furthermore, while research leads to enhanced understanding of certain phenomena, we should also realize the “dark side” of research. For example, while the Internet promotes human communication, it also adversely affects work-life balance. Similarly, the technological advance may lead to more comfortable life but such developments may also bring about pollution and conservation crises.

Finally, when we attempt to promote the quality of life through service, service culture is again another issue we should consider. For example, are colleagues aware of the significance of university social responsibility? Are related initiatives authentic attempts or just window-dressing in nature? Is such work incentivized? Do we have enough funding to support the related attempts? Are human resources processes linked to the related services? These are some of the critical issues that should be considered when we attempt to promote the quality of life through service related to USR.

CONCLUSION

As a corporation, the notion of “corporate social responsibility” is relevant to a university. However, as intellectuals who are usually regarded as the “social conscience” of the society, universities can be regarded as a special type of organizations which have “university social responsibility.” It is argued that universities can carry out university social responsibility through the promotion of the quality of life via teaching, research, and service, although there are related issues that should be addressed.
